Hi Stu, Yes there is 8v present on the element supply and the up/down buttons do work.

# 19048. The MDSR software release V2.1 (SDR on a budget) is now available

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-13 04:32:41 UTC
From: alexschwarz237
Topic: 19048  Message: 19048

The MDSR Development Team has now released the next version of their full RX ☐ TX capable SDR software. The software is available at the MDSR website and the Yahoo user group and the software is free for amateur use. The MDSR software will run on a Windows platform. W2000 and up (works best with Windows XP)

The MDSR software also provides a real time spectrum analyzer and a universal CAT interface that can control 48 different transceivers. Instructions how to use the sofware are included in the software, PDF reader required.

http://groups.yahoo.com/group/mdsradio/ (please register for access to the information)

http://users.skynet.be/myspace/mdsr

The MDSR concept uses an existing transceiver (Yaesu or ICOM have been tested and more will follow)) with a 455kHz IF and a transverter that uses the a 12kHz IF which is fed to the sound card in RX mode and unconverted to 455kHz IF in TX mode. The transverter is connected to the option filter port in the transceiver. The RX audio is heard through the PC speaker. The control of the transceiver is performed through CAT interface.

RX capable hardware is already available through the MDSR group. It is so simple that some HAMs actually prefer to build their own interface. Instructions are available on the website or user group.

This development allows the HAM radio operator to use his/her existing transceiver and computer and connect them together at the IF level for excellent audio quality. SDR performance at a budget cost!

All the best and 73;

The MDSR Development Team

# 19049. IC-706 "silient rx" USB/LSB modes

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-15 17:05:11 UTC
From: John Hogenmiller
Topic: 19049  Message: 19049

Hello,

I have an IC-706 "Mark 1" radio I bought used recently from a hamfest. Everything works fine on 2M. I finally got around to testing it out on HF (actually, I finally got a dipole up to try HF as I got my General recently as well). I found on HF in either LSB or USB mode, the receive is completely silent.

Troubleshooting steps taken:
0) Squelch open all the way and performed a reset on the radio
1) I also have an IC-735. It seems to pick up everything just fine with the dipole.
2) I can Tx with the 706 and hear it on the 735.
3) Switching to AM/FM/WFM on the HF bands makes the radio noisy again (for example, I can hear all sorts of WFM stations around 7Mhz)

Any thoughts? I probably won't want to mess with small surface-mount components, but I do know my way around a soldering iron and small repairs.

Thanks,
John / kb3dfz

From: Will Rogers
Topic: 19049  Message: 19050

Hi John!

If the original 706 is like my MK2g, the Squelch/RF knob should be set around 1 o'clock. The default setting is for Squelch/RF; this works like an RF gain control until 1 o'clock. It then serves as a squelch knob and gets tighter as you turn clockwise past 1 o'clock. It takes an extremely strong signal to open the squelch when set to full clockwise.

Hope this helps!

73!

Will Rogers

Not arguing, but I thought for HF, the most "open" or sensitive position for the Squelch/RF knob is at the 12 o'clock (center) position for the RF gain control knob.

The manual for my "original" 706, on Page 21, states: "The recommended position for RF gain is the center position since this sets RF gain to the max. and squelch just closed."

Also, the RF control must be set properly in SETMODE (mentioned on Page 21), and discussed on Page 45 (Item 20) to use the Squelch/RF gain control for SSB.

You are correct that setting the Squelch/RF gain fully clockwise will fully engage the Squelch.

The only problem I had was using a mag mount mobile. Snap on ferrite cores helped. There can be some odd things happen with 15,17m.
What band, antenna, external, powered external speakers?

I was really hoping that this would be the simple answer. I could then adjust the knob and slap myself for not seeing it in the manual.

Unfortunately, it seems to be silent in any rf gain/sql position. Once I thought back, I had originally started in the "12 o clock" position and then turned CCW when trying to hear anything. Turning CW from either 12 or 1 just increases squelch.

Hopefully this is an easy fix.. I paid $300 for it and that's a good bit of money for just 2M.

# 19059. Re: [ic706] IC-706 "silient rx" USB/LSB modes

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-16 23:00:25 UTC
From: John Hogenmiller
Topic: 19049  Message: 19059

Apparently it does not. I turned both radios to 10.130 and I can hear CW on the 735, but silence again on the 706. Unfortunately, I do not have a key paddle to xmit on either radio. I did try transmitting silence on the 735 but this produced no effect on the 706.

As far as SSB/2M.. I don't have the equipment to test this.None of my other 2M equipment has SSB mode in the 2M section. While this experiment is probably invalid, I turned the 706 and a kenwood tr-7730 to 144.200. The 706 is set to USB mode. When I Tx from the kenwood, I hear a short click on the 706, but I have to have the squelch completely off and into the RF gain side.

# 19061. Low audio on Icom 705 Mk2G?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-17 14:28:23 UTC
From: rci2950sa
Topic: 19061  Message: 19061

Hi everyone

After a couple of months of not TXing on my ICOM 706-MK2G I climbed back onto 10 meters today and noticed something odd when I tried to transmit. Running full power on USB, mic gain at 8, no compression, and using the stock mic, I noticed that the ALC meter only peaked at around 2 or 3, and sometimes it didn't move at all. The power meter also seems a little subdued when I transmit. When I TX full carrier (on RTTY), I manage to get almost a full 100W on an external power meter.

Now I haven't used the rig in a while, so I can't remember if this is a normal reading for the settings I used above. I got the same results on both 2m and 10m on USB. What ALC reading should I expect on USB with a mic gain of 8 without compression? Could there be a problem with my audio?

Best regards
Kevin

Are you measuring the power output on SSB with a true active peak-reading wattmeter?

If not an "active" peak-reading wattmeter, then it reads only the "average" power-out on SSB because there's no steady carrier, and you'll see readings of maybe 1/3 of the peak SSB output.

FM, RTTY and CW (key-down) power-out readings will be the same for peak or average as those output a steady carrier.

# 19064. Re: Audio feedback when transmitting

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-17 15:41:23 UTC
From: Rick M
Topic: 19055  Message: 19064

This happens on all bands, power turned all the way down or up, into a dummy load, antenna, on battery power or home supply - does not matter and happened all of a sudden. Haven't tried it on the air for fear I might further damage something. I suspect a bad internal ground or component failure of some sort. Radio still puts out full power and receives just fine.

# 19065. Help with dead 706 mkII

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-17 18:18:26 UTC
From: Peter Halloway
Topic: 19065  Message: 19065

I was wondering if someone could point me in the right direction. I have a mkii 706 that is not switching on. 13V is getting in to the radio and IC1 is producing 5V for the soft start.
Access to the micro vcc pin is difficult so I have done a voltage check on IC40 pin 8. I was expecting 5V - the volt drop across D89 so around 4.3V but I am measuring 0.77V. Is this pointing to the diode or are there other areas I can look at.

I am hoping the micro is not fried. Any help is appreciated.

# 19066. Better RF Tune Control

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-17 22:30:19 UTC
From: Troynm
Topic: 19066  Message: 19066

I have the Better RF Tune Control for my Icom 706. It works fine except every time the radio is turned on it defaults to tune such that if I key the mike it goes into tune mode. I have to hit the tune button once every time I turn the radio on and then I am fine until the next time. I'm using it with a screwdriver antenna although that has no bearing on the issue. It can be on the same frequency as when I last tuned it up, sometimes minutes before and shut the radio off which really has no bearing on the issue either, but I know people will ask :-)

It's annoying, but if I remember to hit the tune button once every time the radio turns on I'm ok.

Any ideas?

Thanks for the replies. It's weird, but when I reduce the actual power of the rig down to between L and 5, then the ALC seems to give higher, normal readings. But as soon as I increase the power of the rig above 5, then the ALC meter goes dead, even though there is audio output on air when I transmit.

I think it's time to get the rig checked up.

Thanks again!
Kevin

Hey everyone!
Well, I was having the BSoD(blue screen of death) popping up everytime I was using my Prolific USB Hong King Special cable to control the 706 via HRD v5(beta). I hadnt tried it with any other programs, so I figured the cable was bad. Well I tried it with Airlink Express and didnt have any problems. Anyone else have these issues?

The problems with Prolific chip-set adapters and Windows Vista and 7 are well documented, HRD just seems to make them fall over quicker! You can try the latest Prolific drivers or get an adapter with the FTDI chip-set - remember not all Prolific chips are created equal!

If you're looking for a USB CI-V control cable, I like my Western Mountain RigTalk. It allow HRD and MixW to control my 706MKIIG without any problems. No serial or USB adapter needed.

Yeah, I agree Chris because I really like HRD, and all it's workings, but if this is going to make me decide whether or not I use HRD, I will have to do some thinking. I installed DXLabs suite(second time) and the cable works fine with Commander. Also with FLDigi and others. So, yeah, HRD had better get some type of fix going here soon. S'posin I should sign up for the yahoo group for them as well.

# 19079. Main board 706 MkII

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-09 17:17:43 UTC
From: Lars Kvant
Topic: 19079  Message: 19079

Hello everybody

I have run into a problem with my dear old MkII.
One shielded coil, have come lose, and its sitting so
close to another similar coil, that I cant resolder it.

Now I wonder if someone has a mainboard sitting, that works.
Like I said, I dont have tools to fix my own...

# 19081. Kantronics KAM All-Mode TNC to IC-706 interface cable

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-10 18:17:37 UTC
From: lford1951
Topic: 19081  Message: 19081

Looking for good source(s) for the above, either

(1) "ready-made" cable with DB-25 serial connector on the TNC side and a 13-pin DIN connector for the IC-706 Accessory Port on the rig side;
(I am aware of BUXCOMM)

OR

(2) Parts/parts list to build the above, with appropriate pin-out diagrams.

Thanks and 73,

Larry

From: Don Palmer
Topic: 19066  Message: 19082

Tom -

I don't have the Better RF Tune Control, but an item similar to that that generates a 10 watt CW tone for tuning manually - in the "Initial set mode items" of your 706 (hold the "lock" button down while powering up) and get to option 12 and shut off the A-Tune STRT and see if that corrects your problem. Mine is shut OFF. I know that function was intended for the optional AT-180 antenna tuner and to enable it to fire up when the unit was turned on or the SWR high at some point. In any case mine if OFF and the only time I activate that 10 watt tone is by pushing the TUNER/CALL button.

Larry,
No single cable will do everything. I just uploaded to the file area drawings for every cable that you could want - five cables in all. The pin numbers for all connectors are 1 through n from top to bottom. I suggest that you buy a molded pigtail cable for both the 13-pin accessory connector and the 6-pin data connector - these are standard DIN connectors and fairly readily available - then solder a DB-9 on the other ends. Have fun.

73,
Charlie

From: Larry J. Ford
Topic: 19081  Message: 19086

Charlie,

Thanks for the schematics on the pin assignments. I note I forgot to mention that the initial intended use is for VHF only for use on 2 meter packet, but I appreciate the HF drawings as well. I have an ICOM IC-7200 that I would probably use for the HF side.

One question: I note the drawings specify the "KAM XL." Are those pin assignments on the TNC side the same for the Kantronics KAM All-Mode TNC (a earlier version, I presume) which I have?

Also, since neither my original IC-706 nor the IC-706MKII that I have feature the 6-pin data port, I'm stuck with using the 13-pin DIN Accessory Port.

Thanks.

# 19087. IC-706MKII gone wild...

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-13 01:00:24 UTC
From: wb3czi
Topic: 19087  Message: 19087

Hello Group! I have a little problem that one of you may be able to help with.

I was given a dead 706MKII (no G) that upon power-up goes into a continuous downward frequency scan. The up-down buttons still select the bands correctly AND, the main tuning knob if turned clockwise at the "right" speed will "counteract" the downward scan so the encoder's working.

The unit starts scanning wherever it was powered down and counts all the way through 160 then cycles back to 900MHz. (?) The receive LED is ON and the radio is squelched (no audio).

I assume the problem is in the control head but I have no one with a similar radio to swap it for troubleshooting...

Any thoughts? Anyone seen this behavior before?

Joe - WB3CZI

Possibly a stuck "down" button on the mic? (providing the MKll has up/dwn buttons on the mic) my G model does. Have you tried resetting the microprocessor?

Hi Guys... and Thanks but I have tried ALL suggestions below and then some. I even Ohmed-out the mic connector's up/down lines at the control head thinking there may be a de-bounce cap leaking or shorted to ground. What I find strange is that all of the buttons and functions seem to work WHILE it is scanning (counting?) down. I can enter the various menu, change and save their settings - all while the number are spiraling down. A VERY strange problem.

But "Thanks" for the suggestions anyhow.

73,

Joe - WB3CZI

From: Stu Capon
Topic: 19087  Message: 19092

At the risk of sharing my ignorance with the Internet.....

I think the mic buttons signal by pulling pin 2 to 5 (GND) for "up" and via a 470ohm for "down". (don't trust this -quick Googling is not calibrated)
One route would be for the sense voltage to be low or there to be some resistance in that area as you suggest like a leaky cap. If it was shorted I assume it would go UP.

Look up the correct voltage for Pin 2, measure it, if low the rest should fairly easy.

Don,

Thanks for this info. I fixed it. On my radio the option you talk about is not 12 but 27. In any case that did not work. What did work was option 28 - PTT Tune which starts tuning automatically when the PTT is switched. When I turned that off all is now well. My radio is a Mark II G so maybe the menu structure is different.

Thanks!

Tom -

I don't have the Better RF Tune Control, but an item similar to that that generates a 10 watt CW tone for tuning manually - in the "Initial set mode items" of your 706 (hold the "lock" button down while powering up) and get to option 12 and shut off the A-Tune STRT and see if that corrects your problem. Mine is shut OFF. I know that function was intended for the optional AT-180 antenna tuner and to enable it to fire up when the unit was turned on or the SWR high at some point. In any case mine if OFF and the only time I activate that 10 watt tone is by pushing the TUNER/CALL button.

# 19098. Low level carrier

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-18 03:15:14 UTC
From: n4eyz
Topic: 19098  Message: 19098

Turned on rig this afternoon in preparation for a 20m sked. Discovered a substantial carrier when keying the mic. Did not have an accurate meter on it at the time but going by rig meter indications and current draw on metered supply I would guess 25+watts. I checked all setting and ended up resetting processor. Now it's a bit more normal but I still see about 3 watts (Bird 43). I remember years ago adjusting my old HW-101 for minimum carrier. I guess I need to do the same to my 706.
You folks ever had yours do the same?

# 19100. Drift on WSPR

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-18 19:41:15 UTC
From: George
Topic: 19100  Message: 19100

Hello,

First... I searched the group for answers before posting as per instructions received on my 1st. post. No answers that I could find.

I recently got a 706 mk2 g. A very nice rig to be sure. I have a 703 that I have been using on the digi modes.

I know the 703 has TXCO and no so with the 706.

With the 703 there is usually very little or no drift reported. The 706 gets reports on WSPR of 1-2-3 drift with 5w or less.

So folks my question is there any help or tips for drift without purchasing a TXCO for the 706?

Would thermally insulating the stock oscillator crystal help?

Well I'm pleased to report that I'm not as smart as my 706. (I seriously doubt that will ever change) I thought I had a low level carrier and I did. What I didn't realize till earlier this afternoon was that I had enabled a tuning carrier (initial set mode item #28) used to initiate tuning after any frequency change while using the AH4 autotuner. Each time I changed frequency and keyed the PTT a low power carrier was emitted. I guess if I would've kept the PTT keyed a couple seconds longer I would have seen the carrier drop. Turned #28 off and all is back to normal.

Hello,

I bought a used Icom IC-706MKII and I discover an intermittant problem.
After few contact my radio was completly mistuned, frequency error was
terrible and over 3khz and sometimes ok.

After a long investigation I found the culpit. A cold join or a dirty
variable capacitor in the TX Modulation section.
I have reheated all the pads and put a little bit of cleaner and the problem
disapear.

Dont forget, right after that you need to follow the calibration
procedurehave. A good frequency counter or service monitor is a must.

Good luck.

The 706 can be fitted with the optional OCXO, in place of the standard TCXO. Recently I had both my 706 and MK2g running together, the 706 is considerably cooler running (my 706 fan runs all the time, Mk2g cycles annoyingly)

I agree, John.  One of the best mods out there is the Fan Mod, which I did to my MKIIG immediately on buying it (brand new).  Oddly, the IC-7000 fan is the same as the MK2G and it also runs quite hot.  I mod'ed that one the same way after buying it brand new.

Hello group,

The only way that I found to calm the fan w/o any modifications is to run the radio at a lower voltage.
When my station is in standby, I set my Astron variable power supply to 12 Volts and when I use my radio I crank the supply to 13.8 Volts.

I have a MKII and a MKIIG and booth of them react the same maner.

Could it be that, with the fan running all the time, the temps weren't stable enough to keep from drifting. If I got it right, it is the older versions that have more drift issues, right?

I have never notice any with my 'g' (no fan mod).

God bless

The original 706 has a 47 ohm chip resistor (on the PA board) to ground on the -ve side of the fan. This is what keeps the fan running quietly all the time, same could be inserted on Mk2 or later

Why re-invent the wheel - the MK2/MK2g mod is well documented on the net. I think the Athens ARC site has the best explanation. Khune also do a "stick-on" crystal heater that claims better stability than the Icom crystal oven.

Hi David,

Have you tried calling Icom? They seem to be pretty good for getting parts from. If they don't have any Scott at MTS repair might have a few available from parts units.

Hi, can anyone tell me power VR on 706mk2, I have ajusted ALC and thats made it better but on ten metres it peaks about 75w all other bands are ok. before a band policeman tells me I should only be doing 10w this is into a dummy load, no good having a radio thats not performing correctly.
Regards Dave.M3CAD.

LOL... Nice prediction.

It could be related to the output filter section. Have you checked for proper functioning there?

"before a band policeman tells me I should only be doing 10w this is into a dummy load"

Unless the only 50 Ohm load you have is your antenna and you want to adjust for the highest power, in which case you're about 25W low...

Kurt

ok tried all kinda of different ways to see if I can get it to work. it does transmit the playback, but mic audio is not there, PTT and up/down works, just no modulation out to system, not even to record. am I missing something ? if not I will have to wire a different mic up and hopefully that works. My Kenwood works fine. any thoughts ? thanks - Kurt

# 19123. RF carrier usb on 17m/15m

Sounds like it might be going into self oscillation on those bands. That is a somewhat common problem. Take off the top cover, tighten down all circuit board screws, and see if that fixes it.

If that doesn't fix it and it probally will, report back. Someone has a mod. My mk2 does it occasionally. A swift slap on the top cover usually helps mine. I have seen a mod mentioned before.
I will do some digging if need be.

My .02 cents just in case. Under the initial set mode #28 (pg #54 in the book) if that option is turned on then the rig generates a carrier (albeit a short one) each time the ptt is pressed. It's for AH4 tuner adjustment. I inadvertently enabled that on mine and is caused some confusion till I realized what I had unknowingly done. Probably not your problem but what the heck---thought I'd mention it.

Good luck!

ok so I read that because hm-103 is a electret condenser mic, that it needs voltage to operate and Icom inserts it thru the mic line, so that is probably the reason for not having audio right ?! so mfj has a voltage setting with jumpers inside the 434b, anyone know what voltage setting ? and what pin it will send it on ?Someone probably have run a set up like this somewhere, any info please. thanks kurt

# 19132. 118-inch SS whip antenna element - source?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-27 16:22:21 UTC
From: Larry J. Ford
Topic: 19132  Message: 19132

Do any of you know a good source for an 118-inch SS whip antenna element? Not having much luck with Google.

I have an ICOM AH-2 autotuner that the specs say will match 3.5 MHz to 30 MHz with an antenna element longer than 3 meters. 3 meters is a bit longer than 118 inches, but I really only want to match 3.9 MHz and above, so 118 inches should work.

This would be for a mobile installation with the ICOM AH-2b antenna base, and an ICOM IC-706MKII.

I'll be going to the Lawrenceville (Stone Mountain, GA) hamfest next weekend; any vendors likely to be there that would carry an 118-inch whip?

Thanks and 73,

Larry J. Ford

Got one of those, but need another 16 inches to meet the tuner spec for 80 meters unless something like a "capacitance hat" would work and could be jerry-rigged onto the 102-inch whip.

As a temporary test solder a stiff piece of wire to an alligator clip and clip it to the top of whatever whip you currently have and try loading up while stationary. Experiment to see how short you can get away with. Maybe you won't need as much whip as you think. A capacity hat on top of a 102 inch whip will produce a horizontal whip at 40-60 MPH!

For what it's worth--I ran my 706G mobile for many years using the AH4 tuner. I initially ran a 102" CB whip and spring with ok results. Although it's tough to do really well on 75 meters with 100 watts mobile. But I really didn't like all that steel whipping back an forth on my truck. I replaced the whip with a 40M hamstick (still fed with AH4). Antenna was nicer looking (IMO) did not flap as much and loaded up much easier on everything from 75 to 6 meters. God decent signal reports too for a 100w mobile. And hamsticks are not expensive. Think I paid $20 at a hamfest.

When you go to the ham fest, look for a real 80M mobile antenna (if there is one) such as a Texas Bug Catcher or Screwdriver. The efficiency should be better than the 118" whip.

The best thing may be to find a Army surplus whip and bend it over the car.

I am sure you have read the many post about 75M Mobile Shoot-outs and such. 75 M mobile is a challenge.

From: Dave Santoro - W6BTS
Topic: 19132  Message: 19140

Larry,

I have almost exactly the same setup in my vehicle excepting that I'm using the AH-4 tuner.

I purchased a 108" SS Whip from Radio Shack, added a quick disconnect adapter and a heavy duty Mil-Spec spring and my matches are very nearly flat across the HF band including 6mtr. I get very good signal reports and no complaints from other nearby stations.

This setup also allows me to connect a long wire to the top of the whip increasing the ease of tuning and improving signal effect.

BoL & 73,

Dave - W6BTS

I figured-out your "little" joke! A Google search for 118" stainless steel whip antenna will bring up a listing for .188" (diameter) stainless steel whip antenna, which is what that website lists.

There's a wisea$$ in every crowd.

Larry,

I forgot to mention, I modified my AH-4 and installed PL239 jacks for input and output. In this way I've all but eliminated the risk of hands or other items contacting any high voltage and allowing full coaxial connections. No comments from the peanut gallery please, it's functions perfectly, no worries.

73,

Dave - W6BTS

Ah!

I missed the dot. .118"

My bad. :/

What about making something with all thread or the likes there of.

Sorry about the missing the dot. I was excited for a minute.

Except they are not PL239's. I think you mean SO-239's which are chassis mounted female connectors that mate with the PL-259's which are on the end of the coax. We know what you meant.

From: Mike Rodgers
Topic: 19132  Message: 19146

In my mk2 manual it notes using the AH2b antenna which is a 2.5m long.
I think the only way to get a 118" whip will be to get a extension made or use a 18" one. Texas Bugcatcher used to make some nice ones of various lengths. I would try the 102 and if it won't tune, try the alligator clip wire extension before going to all that trouble/expense.
The extensions bugcatcher made were stainless steel tubing about 1/2 or 3/4 with nuts welded on the end.
The original Texas Bugcatcher was sold and I don't know current status but google will.

Good luck with the project.

From: Larry J. Ford
Topic: 19132  Message: 19147

While at the Lawrenceville/Stone Mountain (GA) hamfest next week I'll look around for a 108-inch whip. Guess I'll have to carry a tape measure with me!

The element that ICOM furnished with the AH-2b antenna system was spec'd at 2.5 meters long, which slid down into the antenna element holder about 13 or 14 centimeters, and secured with Allen screws. The antenna element holder in turn screws into the mount base. The element holder is about 6 inches long and the mount base probably about the same, so it may all add up to 3 meters or close. The AH-2 tuner that was spec'd to match 3.5 MHz with an antenna of 3 meters or longer is physically bigger than the subsequent model AH-4 (which requires a lot longer element to match 3.5 MHz), so it probably has bigger coils/inductors or whatever that allows it to match 80 meters with only 3 meters of antenna. Interestingly, the AH-2 autotuner is also spec'd to match >1.9 MHz with an element of 12 meters or longer, which the AH-4 is not spec'd for (although has been known to match).

Of course, with an antenna length of only 3 meters, the efficiency on 80/75 meters is going to be very low, but it beats nothing, which I have for mobile HF right now! But if the bands keep coming back like recently, 40 meters (and maybe 60) should be OK with that set-up, and 20 through 10 should be a lot of fun!

I figured-out your "little" joke! A Google search for 118" stainless steel whip antenna will bring up a listing for .188" (diameter) stainless steel whip antenna, which is what that website lists.

There's a wisea$$ in every crowd.

From: Joe
Topic: 19132  Message: 19151

I've tried a tuned whip down there and it's pretty much a dummy load. Couldn't make a single contact. I think all the effort of coming up with a slightly linger whip won't pay off. Even 40m was a little dicey. My Hi-Q on the other hand performs quite well on 40/75m...

OK, I was just about right with my "guesstimates" on the overall length of the radiating part of that set-up with the stock antenna element plus the element holder and the base/spring.

I paid <$200.00 for the AH-2 tuner AND the AH-2b antenna system from another ham, but the latter was missing the antenna element and antenna element holder, which I replaced fairly cheaply.

Thanks.

I figured-out your "little" joke! A Google search for 118" stainless steel whip antenna will bring up a listing for .188" (diameter) stainless steel whip antenna, which is what that website lists.

There's a wisea$$ in every crowd.

And you paid $???? for your Hi-Q model?

Are you saying you tried the ICOM AH-2b mobile antenna system with a "tuned whip" and couldn't make a contact?

Let's talk "apples to apples," here, not "apples to oranges."

I have considered selling-off all the mobile stuff I have to put that money toward a good screwdriver system, but that would likely require at least another $200 -$300, and I don't exactly have the best mounting place or vehicle for a big screwdriver. I'd be limited to something like the Tarheel II (don't know what the Hi-Q equivalent is), which might not do any better than the AH-2b system with a 108-inch whip and the AH-2 tuner.

Is Hi-Q the brand of screwdriver recommended by Alan Applegate, K0BG?

From: Dave Santoro - W6BTS
Topic: 19132  Message: 19154

Larry,

Well I'm somewhat ashamed to admit it but about two years ago I fell for the ICOM hype on the AH-2B antenna kit. I paid full retail and anxiously brought it back to my shop intent on installing it. Now the intended target vehicle was my trusty Nissan Quest Van that I've upgraded to support extended field operations including dual batteries, 200 amp alternator, solar panel backup and deployable grounding straps. Other then the appearance of a land-locked fishing boat, minus the Seagulls it still serves as a useful mini van.

But I digress, after considering the AH-2b's mounting requirements, quite hefty, I decided that the entire thing belongs on the back of a HUMMV rather then my little Quest. So back into the box and into storage waiting for that two ton lifted 4x4 super-cab that wont fit in my shop let alone the driveway.

Subsequently I purchased a commercial heavy duty ball mount and equally rated spring. This I mounted to the left rear quarter panel about 24" above ground level. This location was decided as a compromise between eutectics and magnetic density of the vehicle as determined with a portable magnetometer. the perfect location would have been in the middle of the rear gate directly onto the glass wind screen, not gonna happen.

Okay to the point. I measured the entire ICOM mount and radiator/whip and found that by installing a quick disconnect at the base of the whip and the top of the spring the electrical length was identical to the AH-2B with just a tad less resistance which couldn't hurt.

I mounted the AH-4 tuner 6" away from the mount on the interior side panel and fed that with 12" of RG8 and fed the AT-4 with 19' of RG8 from the 706mkII mounted under the drivers seat with the control head mounted center dash just above the A/C vents.

I have found that center band on 20mtr, 10mtr and 6mtr will operate within tolerances without the tuner but I prefer to not stress the finals unnecessarily.

When I find the need to increase the antennas efficiency I simply attach a long wire onto the top of the whip and shoot the other end over a tree or send it up a post.

I've had very good reports working HF while driving on the interstate at 65Mph as well as from on top of the local high points here in San Diego. I've found that even with the heavy duty spring the whip tends to lay too horizontal much above 65Mph so I keep that under control when working mobile.

I know that there is an eliminate out there that demands a perfectly designed and matched antenna for the operational band all the way up in the air on a 50+" tower with 500+ watts forcing a signal where it sometimes doesn't really want to go. But there is room for everyone in this hobby. That's why I invest so much effort and time into all-band mobile operations. It's challenging and vexing, not always rewarding but it's always fun. At least for me it is.

Best of luck with your installations and with skill and a bit of luck maybe we'll work each other sometime.

73,

Dave- W6BTS

OK, I was just about right with my "guesstimates" on the overall length of the radiating part of that set-up with the stock antenna element plus the element holder and the base/spring.

I paid <$200.00 for the AH-2 tuner AND the AH-2b antenna system from another ham, but the latter was missing the antenna element and antenna element holder, which I replaced fairly cheaply.

Thanks.

Larry,

One last thought. The dramatically over priced ($350.00) ICOM AH-2 Whip Antenna kit includes a whip element of just 96" with the base and spring being 13-3/8" making the factory unit 109-3/8" total. Try for the 108" whip from Radio Shack, I think you'll do fine with that.

73,

Dave - W6BTS

Larry, I am sure that you are aware that ANY center loaded mobile antenna on 75/40 meters will outperform a simple whip.

The reason is simple: The RF radiation is produced by the current in the antenna. A center loaded antenna has MUCH more current flowing in the bottom 3 or 4 feet, the section below the coil, than the same length of a simple whip. See the ARRL antenna Book for further details.

DD, W1MCE

Just remember that military uses their bent over whips as NVIS antennas and not for dx.

FWIW, I vouch for the screwdriver, even as a manual tune setup. They now have a setup that automatically tunes teh screwdriver, kind of like the auto tuner but without the drawbacks. Best of both worlds! Sorry, don't remember where I saw that but maybe food for thought.

God bless

Something else to think about. I don't know how this may effect auto tuners but my dad (ka7swi) has the same screwdriver as I but with a steel whip, mine is fiberglass. His flexes much more than mine at cruising speed...to the point that he will have to retune on 40 meters if he initally tuned while stopped. I may have to touch up the tune on 80 meters but that is to be expected, as narrow as that band is.

My point is that, while cruising the flex difference may be enough that a CB fiberglass whip may perform better than a 118 inch steel whip.

Define "ANY center load mobile antenna" and define a "simple whip."

Also, do you consider the ICOM AH-2b antenna system, matched with the AH-2 autotuner, as a "simple whip?"

Just making sure we're clear on definitions, and not compares "apples to oranges" here (OK, both grow on tress, are somewhat round, but ... ;-).

Larry, I am sure that you are aware that ANY center loaded mobile antenna on 75/40 meters will outperform a simple whip.

The reason is simple: The RF radiation is produced by the current in the antenna. A center loaded antenna has MUCH more current flowing in the bottom 3 or 4 feet, the section below the coil, than the same length of a simple whip. See the ARRL antenna Book for further details.

Subject: Re: [ic706] 118-inch SS whip antenna element - source?

And you paid $???? for your Hi-Q model?

Are you saying you tried the ICOM AH-2b mobile antenna system with a "tuned whip" and couldn't make a contact?

Let's talk "apples to apples," here, not "apples to oranges."

I have considered selling-off all the mobile stuff I have to put that money toward a good screwdriver system, but that would likely require at least another $200 -$300, and I don't exactly have the best mounting place or vehicle for a big screwdriver. I'd be limited to something like the Tarheel II (don't know what the Hi-Q equivalent is), which might not do any better than the AH-2b system with a 108-inch whip and the AH-2 tuner.

Is Hi-Q the brand of screwdriver recommended by Alan Applegate, K0BG?

I've tried a tuned whip down there and it's pretty much a dummy load. Couldn't make a single contact. I think all the effort of coming up with a slightly linger whip won't pay off. Even 40m was a little dicey. My Hi-Q on the other hand performs quite well on 40/75m...

From: Deacon Dave
Topic: 19132  Message: 19160

If I recall correctly Kraus, et al, define antennas less than 1/8 wavelength as shortened antennas and present university level analyses of their performance.

Definitions for typical ham radio HF mobile operations.

1) Center Loaded ... an electrically short vertical antenna less than 1/8 wavelength long composed of three sections: the lower section is from the mount to the base of the loading coil and exhibits a length of typically 2.5 to 4 feet; this feeds the base of a loading coil; and finally, the top section which mounts from the loading coil to the tip which may lengthen the overall length to eight or slightly more feet [must pass under an interstate overpass at 13.5 feet.]

2) A simple whip ... an electrically short vertical less than 1/8 wavelength long antenna with a length less than 13.5 feet [must pass under an interstate overpass at 13.5 feet.]

3) Base Loaded ... which was/is not included in the discussion. It is an electrically short vertical antenna less than 1/8 wavelength long composed of two sections. The base contains the loading coil which may be either High-Q or Low-Q design. [Short and fat; or, long and narrow respectively] The top of the coil supports a top section which lengthens the overall length. [must pass under an interstate overpass at 13.5 feet.]

I have never used the AH-2 and associated antenna AH-2B in 50+ years of HF mobile. But I suggest the antenna is more base loaded than center loaded.

I have used simple whips and the Hi-Gain base loaded system of the 1960s in the past [1955 - 1990]. In my current mobile I use the Hustler center loaded antennas, at times with the 'porcupine adapter' [provides 4 bands] with the AH-4.

My original comment was intended to notify that the poorest 75 meter antenna is the simple SS whip. A base loaded antenna has better performance; and, a center loaded has still more performance. The radiated efficiency on 75 is typically -18 dBd for a simple whip [1 watt ERP for a 100 watt radio] and -12 dBd for center loaded. [10 watts ERP for a 100 watt radio.] [This will vary as a function of the integrity of the vehicle/antenna grounding system.]

Larry,

I've been running a Little Tarheel II with my IC-706MKIIG for a couple of years (Using a Turbo Tuner). I've been very happy with it.

For instance just a couple of weeks ago had a nice QSO with a Mexico City station on 20 Meters while driving down the interstate near Middletown Ohio in the middle of the day. Maybe I'm easily impressed, but I thought that was cool! So did the brand new ham that was riding with me. (Pics of the installation on my QRZ listing

Not sure how that compares to the AH-2 and whip, and haven't done a lot on 75/80 (although I have made a few contacts there) but I sure wouldn't feel very "limited" with a Tarheel II.

My input for what it's worth

It's my understanding that the "bigger" screwdriver antennas with bigger coils, etc., perform better on the lower bands, but I just don't have the type of vehicle that lends itself to mounting one of those larger screwdrivers.

Now, if drove a big Dodge RAM truck, that would be another matter!

Larry, folks have gotten pretty inventive with mounts.
There are many pictures on the websites. For me it's the cost and I don't do much mobile anymore except now that 10 is open. So there's probally a way.
I've run mostly the hustler triple tree and
Dabbled some with a two foot cb Wilson fiberglass with longer whip stingers. A analyzer is most helpfully for the latter. 40&75 is out of the question however with the latter.

I've seen many on compact cars with the small coil so it's not just for us dodge ram types. In fact I ran the hustler triple tree on top of the cab with 24" mast on a 4 mag mount.

# 19170. HM-133V Microphone

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-28 22:46:17 UTC
From: Matthew Bonser
Topic: 19132  Message: 19170

Hi All

I recently purchased a HM-133V microphone from Ebay, now given the price I paid for it I am assuming it is not a genuine one, but rather a cheap chinese copy.

The actual ebay link is here*http://tinyurl.com/4xfok6q*

I'm wondering if anyone else has had any success with this type of microphone on the IC706MKIIG ?

The microphone appears to power up ok when connected to the radio, all the lights come on and red PTT light on the microphone illuminates when you push the button, but it doesn't actually transmit on the radio.

I understand that the DTMF function work on the IC706 but I thought it might still transmit.

If I have wasted my money it's not a big deal, it was cheap enough that I'm not that concerned, but I thought I would check to see if anyone else has used on of these on a 706.

Thanks

# 19171. ICOM 706 mk1 Problem with FM.

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-29 01:52:19 UTC
From: Steve
Topic: 19171  Message: 19171

I have been on the forum for awhile. just hanging out to learn.
I have owned my 706 about 1 1/2 years and it has worked great untill last weekend.

After making about 20 dx contacts, one was a fm simplex contact on 10 meters. the first time i used fm on 10 meters. I then went to 2 meters to a local repeater. the vfo froze and i had to do a hard reset on the rig.

This is the first time that happened. i then went into the set up menu and reset everything. the next evening i checked into a 6 meter net on fm the guys said i sounded like i was over deviating or off frequency. I found a post about the fm vco and went to check the voltage at CP4 and the rig will not key up on fm on any band including 2 meters. The watt meter jumps momentarialy to 50 watts and drops back to 0. All other modes are fine. Thanks for any help 73 Steve

# 19172. Re: 118-inch SS whip antenna element - source?

Yahoo group: ic706 (2010 — 2015)

I hear that in the outback of Austrailia, most folks use a 7 mhz or 10 mhz antenna fed by an autotuner for all band operation with great results. So why not us a 30 or 40 meter Hamstick with your Icom tuuner ? The extra loading from the helical winding would allow more efficiency on the low bands than a 118" whip and would probably be much cheaper in the long run. Don't use an 80 or 75 meter Hamstick though if you want to run the higher HF bands because the helical winding being so much on the 80 meter coil will act as a choke and only the lower protion of the antenna will radiate on the higher bands.

# 19173. HF Instability

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-30 02:43:45 UTC
From: wa0acf
Topic: 19173  Message: 19173

I came to this group to see if anyone had experienced any of the symptoms that I noticed in my Icom 706 MkIIG (s/n 1501748, purchased new in 2003). I found some older messages in this group about "RF Instabilities" and I read the Icom Service Bulletin #928 about the ground clip. I think there is a wider problem. Here are the symptoms I observed and the actions I took to fix the problem (so far!)

Symptoms:
Field Day 2009 I noticed that I could receive pretty well but no one was answering my calls. I changed bands and I got answers so I figured it was just band conditions, or a poor antenna installation. Field Day 2010 I took along an MFJ antenna analyzer and a Bird 43 wattmeter. The antennas measured fine with the MFJ analyzer. The radio tuned up OK on most bands. After a few hours of operating I noticed that between CW characters the wattmeter would hang up around 20 watts instead of dropping to zero between characters like it usually does. At that point I suspected an intermittent connection(s) in the radio. Not having any other test equipment I resorted to a solid "whack" on the radio (!). That surely seemed to fix the problem for many hours. At that point I didn't know if it was intermittent relay contacts, a loose connector, or whatever.

With 10 meters becoming much more active lately I set up my first mobile installation with a 102" whip and an AH-4 tuner for the ICOM 706. Several bands between 40 and 10 meters would not load up consistently. Again, the RF power output between CW characters would hang up around some lower value before dropping to zero. It was time to find the "root cause".

Fix:
I took the radio apart, top and bottom covers. I noticed that the ground clip on the Band-Pass Filter board was loose to the point of rotating when I touched it. Many of the board screws were so loose I could turn them with a screwdriver between my thumb and forefinger. The same was true of the Power Amplifier board, which is truly scary. I tightened all of the screws on the Power Amplifier board, and MOST IMPORTANTLY, the power transistor mounting flanges!! When I reassembled the radio and installed it in my mobile installation the radio loaded properly on all bands.

Reasons:
The MOSFET power transistor mounting flanges are the source of the FETs. The tabs are the gate and drain. It is extremely important that the source (the mounting tabs) have a very good ELECTRICAL contact to the chassis AND a very good THERMAL contact to the chassis. A degraded electrical contact will increase the impedance between the source and

ground, apparently causing amplifier instability just as in a high gain bipolar device. On top of that, a degraded mechanical connection to the heat sink will increase the thermal impedance between the MOSFET die and the heatsink and ambient air. (Google 'thermal resistance wikipedia' to see the analogy to Ohms law) The RD70HVF1 power MOSFET data sheet shows that the 'Theta JC' for this part is one degree C per watt. That means if there are 50 watts of heat at the die of the MOSFET, the 'thermal drop' across Theta JC will cause the junction temperature to be 50 degrees C hotter than the heat sink. So, above all else, make sure the flange screws are tight and the board screws are tight to the standoff bosses.

NOT TOO TIGHT! You don't want to break a screw off in the casting. Typical torque for a #4 or #6 screw is about 5 to 9 inch pounds. Don't over-do it.

This fix has eliminated the intermittent RF behavior in my radio and I believe the reasons are technically correct.

I agree with Rick and would add that if you can find one the SGC 9 foot helically loaded whip is a great way to go.

I have used that whip on off road jeeps probably about 10 years or so now with the AH4 and never had an issue with either, and have found the 80/6/40 meter performance to be much better than Hamsticks or my steel whip, and it's insulated which is a big plus offroad.

In the beginning I did some comparisons on 40 between the Hamstick and the Sgc as an allband set up and with an extension added to the base of the hamstick of about 30 inches it worked almost as well as SGC but matching on 60 and 80 was harder. Without the extension the SGC was routinely preferred over the stick on 40, but never saw much difference on 20 and up.

# 19175. Mic jack on Icom 706

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-30 18:59:58 UTC
From: John Geiger
Topic: 19175  Message: 19175

I have an Icom 706 original and am wondering exactly what is needed for the microphone on this rig. In terms of the mic jack, does voltage need to be applied along with the audio in? I am wondering if I can run a cable from my computer sound card out jack to the audio in and ground connections on the mic jack and get it to work with VOX, or is some sort of voltage or other signal also required to get the audio to work correctly? I am still not completely clear about the Icom mics and the preamp being in the mic and things like that. I should be, though.

John, you can pad the audio level with resistors or following good practice isolate the DC with a 0.1 uF capacitor, more to not upset your soundcard than the radio. You can use the front or rear mic connector and have the VOX operate, if you use the ACC connector for audio in then VOX will not operate. I use the ACC connector for audio out to soundcard as its a set level unaffected by the vol. control.

Topic: 19175  Message: 19177

YOu do not use the voltage on the  mic jack.  Just  feed the audio into the mic input and use a capacitor to block any DC that might get into the signal line.  There is often too much audio comming out of the Icom, so a resistor or two may be needed.

You can usually use the VOX to do the keying in most modes.
Just make sure the mode you are using has some audio on it before the actual data starts.

The voltage comming out of the Icom mic is just to power the preamp built into the mic or a touch tone mic.  I hooked up a Sure mic to mine and used the 8 volts to power up that mic as it usually operates off a 9 volt battery.  Works fine.

If you go to several sites, there are some that show a schematic of the interfaces.  Look them over before you start on one.

Unless you have the parts on hand, there are some places that sell the interfaces already built almost as cheep as one can be built.

Thanks to everyone for the feedback so far. After casual playing around in the CQWW contest this weekend I see that I need some sort of voice keyer, and getting on RTTY again would be nice also. I am looking for a cheap way to interface the 706 with the computer-cheaper the better. I was hoping to just run a line from the computer jack to the mic jack. Sounds like it is doable but will need a little more work.

# 19179. current drain while off?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-31 01:32:07 UTC
From: David Westbrook
Topic: 19179  Message: 19179

Hopefully this isn't as silly a question as it sounds in the subject line :)

With IC706MKII radio off -- when turning on/off the power supply (or connecting/disconnecting battery), I can hear a relay click ... So what, if any, is the current drain while power source is connected, but radio is off?

The "Ch.13 Specifications" page of the manual doesn't mention anything. And i'm not very familiar with how relays work, but I assume something holds it in the non-resting state (hence the click with power connection; and again w/power disconnect)?

Source of the question is that I'm just starting out on battery/portable/mobile operation, and wonder if it's bad to leave the battery connected (e.g. overnight or a couple days) when radio's not in use. It's just a UB1280 (8Ah), so nothing big.

thanks,

My 706G is on an Astron 35amp metered supply. Don't know how accurate the front panel meters are and they only are in 2 amp increments but my rig shows a hair under 1 amp when the rig is powered off. Approx 2 amps on and squelched.
Probably not a good idea to keep it hooked up to a battery all the time.

David, it is normal!
The radio does draw a small amount when off like a TV or radio does it is in a standby state there is still power to part of the radio and when you push the power button it turns the rest on.
I have mine in my Suburban and it can sit for days with out bringing the battery down.

Recently purchased a IC-706 off the Internet and finally today decided to hook it up to a Astron DC P/S to see if it worked..initially, after hooking it up to the P/S and pushing the power button..I would hear a "clicking" noise and nothing in the screen at all. I use this particular P/S on my other radio and it works FB. Tried another P/S I had and same indication. Pulled the cover & checked the fuse, it appears to be fine. Now, when I hooked it back up to the P/S...it doesn't even emit a clicking noise. Guess I may have learned an expensive lesson about buying things "used" off the Internet. Any help or guidance would sure be appreciated. Tnx Charlie

check the fuses in the power cord take then from the holders and clean the contact areas, when you hook it up you should hear the relay pull in to standby, also clean the contacts between the head and body this is where a lot of problems at solved. there are a few other spots that can be checked but lets start here with the common ones.

# 19184. Re: [ic706] Mic jack on Icom 706

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-31 05:07:28 UTC
From: Dave Wright
Topic: 19175  Message: 19184

Hi John,
It's simple to do, using the VOX for digital modes, in fact I did it for free(well, relatively speaking)

Get a length of CAT5 cable with the connectors on it. 3 1/8th mono audio connectors, 2- 600:600 ohm audio transformers

Cut one end off of the cable. This will be the PC end.

The other end is the mic connector. A pair of the wires will be used for the speaker out from the radio, so keep that in mind. After figuring out the layout of the mic connector to the CAT5 cable layout, snip the pair you dont have assigned. Solder on one of the audio connectors. That pair will go to the mic in on the PC.

The other pair will go to ground/VOX on the radio thru the jack, so solder the audio connectors on the pair you have designated for the VOX/ground. That will go to your speaker out on the computer.

Somewhere in line, you will need to put in the transformers. This helps even out the audio and makes adjusting the levels easier. If you get confused or need help, please let me know.

Since you connected, then disconnected, then connected again and the problem
got worse, I'd suggest checking the notoriously bad "Molex" connector for
looseness and corrosion.

It's my understanding that the "bigger" screwdriver antennas with bigger coils, etc., perform better on the lower bands, but I just don't have the type of vehicle that lends itself to mounting one of those larger screwdrivers.

Now, if drove a big Dodge RAM truck, that would be another matter!

Larry,

I've been running a Little Tarheel II with my IC-706MKIIG for a couple of years (Using a Turbo Tuner). I've been very happy with it.

For instance just a couple of weeks ago had a nice QSO with a Mexico City station on 20 Meters while driving down the interstate near Middletown Ohio in the middle of the day. Maybe I'm easily impressed, but I thought that was cool! So did the brand new ham that was riding with me. (Pics of the installation on my QRZ listing

Not sure how that compares to the AH-2 and whip, and haven't done a lot on 75/80 (although I have made a few contacts there) but I sure wouldn't feel very "limited" with a Tarheel II.

My input for what it's worth

Subject: Re: EXTERNAL: RE: [ic706] 118-inch SS whip antenna element - source?

Something else to think about. I don't know how this may effect auto tuners but my dad (ka7swi) has the same screwdriver as I but with a steel whip, mine is fiberglass. His flexes much more than mine at cruising speed...to the point that he will have to retune on 40 meters if he initally tuned while stopped. I may have to touch up the tune on 80 meters but that is to be expected, as narrow as that band is.

My point is that, while cruising the flex difference may be enough that a CB fiberglass whip may perform better than a 118 inch steel whip.

God bless

# 19188. Re: HF Instability

Yahoo group: ic706 (2010 — 2015)
Date: 2011-10-31 13:44:56 UTC
From: voip10
Topic: 19173  Message: 19188

This issue is not uncommon with the IC-706 and has been mentioned elsewhere in the group, though it's always interesting to read of folk's experiences. I have a II-non-g, and had noticing something similar, in my case it was variable output power when tuning up on the upper HF bands, such as 18 and 21MHz, which would settle after a while. Connecting the rig up to an MFJ 993 autotuner, the symptoms included difficulty in autotuning. When I noticed the frequency counter on the ATU was displaying somewhere in the region of 23MHz, before settling down on the 21MHz frequency I had set the rig to, it was time to do stop using the rig and doing something about it.

Similarly to your case, tightening the screws holding down the PCBs and cleaning up the areas involved in forming the sprung contact to case connections removed the instability issues. The output devices were all still tightly screwed down in my case.

I guess the standby current draw of the IC-706 means it warms up quite a bit during use. Coupled with fact that the PCB mounting screws are coarse-threaded self-tappers, the repeated expansion-contraction would tend to encourage loosening of the screws over time to a greater extent than some of the other rigs I have used.

From: Larry J. Ford
Topic: 19190  Message: 19190

Dave,

You don't know how close to the truth you are!

If I had thought it through completely this past April when a lady (I use that term loosely) ran a red light and totaled my 2006 Honda CR-V, and the insurance company made a very fair settlement with me, I SHOULD have bought a truck! Perhaps not a BIG RAM truck, but maybe a little one. Then I could just stick as many antennas on as I needed or liked.

Unfortunately, in the haste to get a new vehicle and get out of that rental (I'll claim I was still "dazed" from the accident), I rushed out and bought a new 2011 CR-V. (Honda made it real easy to do that and rolled unused extended warranty mileage from the 2006 into a credit towards the 2011) The new CR-V is less SUV than the previous edition and more car-like (good reason it's called a "cross-over" vehicle), and has greatly reduced the mounting opportunities.

If I wouldn't take a financial bath, I'd just sell the CR-V and get me a used pick-up and put a big screwdriver on it and be done with it!

Larry J. Ford
KG4GPJ

P.S. Down at the North Carolina ARES Western Regional meeting in Morganton, NC, this past Saturday, I did see a "cross-over" SUV about like my CR-V that had a Tarheel II antenna mounted on the rear door. The installation looked very clean and the Tarheel II is of such size that it doesn't seem to "overwhelm" the vehicle. Unfortunately, I didn't know whose vehicle it was so I couldn't ask them about performance.

I wonder how a Tarheel II mounted halfway up the rear hatch door would perform relative to a 102/108 inch whip based loaded with the AH-2 tuner?

It's my understanding that the "bigger" screwdriver antennas with bigger coils, etc., perform better on the lower bands, but I just don't have the type of vehicle that lends itself to mounting one of those larger screwdrivers.

Now, if drove a big Dodge RAM truck, that would be another matter!

Larry,

I've been running a Little Tarheel II with my IC-706MKIIG for a couple of years (Using a Turbo Tuner). I've been very happy with it.

For instance just a couple of weeks ago had a nice QSO with a Mexico City station on 20 Meters while driving down the interstate near Middletown Ohio in the middle of the day. Maybe I'm easily impressed, but I thought that was cool! So did the brand new ham that was riding with me. (Pics of the installation on my QRZ listing

Not sure how that compares to the AH-2 and whip, and haven't done a lot on 75/80 (although I have made a few contacts there) but I sure wouldn't feel very "limited" with a Tarheel II.

My input for what it's worth

This guy named "Ford" hasn't driven a Ford in years! In fact, the last Ford I drove regularly was my parents' Ford Falcon back in the late '60s/early '70s.

However, I do like some of the recent models and might go back. A little Ford Ranger truck might make a good platform for a screwdriver antenna.

Another thought for longer whips would be to contact Wilson Antennas about obtaining one of there bottom shafts for a mirror mount Wilson 1000 or 2000 antenna (CB antenna). I think the shafts come in one and 2 foot lengths and they have 38" x 24 threads on both ends and could easily be coupled to one of the Radio shack 102" whips which I hear are really only 96" and the optional spring adds another 6 inches. Also, you could go to a machine shop and buy a stainless steel 3/8 in rod about any lengths and have them tread each end to make any length extension you need. I've done that before and have a 4' extension that I use with a homebrew bugcatcher antenna. To couple the estension to a Radio Shack whip would only require a 3/8" coupler nut available from many sources like the folks at Tower Electronics - www.pl-259.com

Use a MFJ-1966 108" SS whip, a Lakeview 009HD quick disconnect, and a mobile spring mount (CB style).

A judicious application of Deoxit will work wonders for corroded, dirty, or sticky contacts and switches.

As measured, 20C ambient:

13.80V input = 3.75mA
12.75V input = 3.64mA

Hi Dave,

Thanks for the feedback, sounds like a doable project. Now to just find the parts and get going on it. I am sure I am not the only one who will be interested in your plans, thanks for taking the time to share it with the list.

Hi John,
It's simple to do, using the VOX for digital modes, in fact I did it for free(well, relatively speaking)

Get a length of CAT5 cable with the connectors on it. 3 1/8th mono audio connectors, 2- 600:600 ohm audio transformers

Cut one end off of the cable. This will be the PC end.

The other end is the mic connector. A pair of the wires will be used for the speaker out from the radio, so keep that in mind. After figuring out the layout of the mic connector to the CAT5 cable layout, snip the pair you dont have assigned. Solder on one of the audio connectors. That pair will go to the mic in on the PC.

The other pair will go to ground/VOX on the radio thru the jack, so solder the audio connectors on the pair you have designated for the VOX/ground. That will go to your speaker out on the computer.

Somewhere in line, you will need to put in the transformers. This helps even out the audio and makes adjusting the levels easier. If you get confused or need help, please let me know.

You might have some troubles with the ranger.

I drive a 2003 Ranger 4 cylinder. The fuel injector noise is just terrible on the lower bands. I have an EE degree and managed an engineering EMC/EMR/EMRH/EMP group for years. After 8 years I STILL have fuel injector noise that kills in 75 meters when driving above 55 mph.

This guy named "Ford" hasn't driven a Ford in years! In fact, the last Ford I drove regularly was my parents' Ford Falcon back in the late '60s/early '70s.

However, I do like some of the recent models and might go back. A little Ford Ranger truck might make a good platform for a screwdriver antenna.

# 19207. Re: [ic706] 118-inch SS whip; now EMP

Yahoo group: ic706 (2010 — 2015)
Date: 2011-11-01 20:40:01 UTC
From: Deacon Dave
Topic: 19132  Message: 19207

Disconnect from ALL external wires & cables.

Place INSIDE a 100% aluminum suitcase. Close and latch suitcase when not in use ... Seriously.

- - - - -

If an EMP event occurs while on HF and connected to the antenna the rf stages are cooked. EMP spectral density has maximum values from 160 to 20 meters.

The standard EMP model is 50,000 volts per meter with a rise time of 0.01 microseconds [10^-8 seconds] and a pulse width of several microseconds. [NOTE: a 1/2 wavelength long 80 meter antenna could "see" a 2 million volts broad band field intensity between the ends of the antenna. GULP !! When I left the design world the best protection for HF receiver front ends were VACUUM TUBES ... true!

EMP pulse rise time is 10X quicker than lightning and the field intensity is 2 to 3 times larger than lightning. The spectral energy maximum occurs about 5 to 10X higher than lightning. In today's design world I would add a 100% shielded vacuum tube pre-amp connected to the radio by 95% double shielded coax using Type N connectors. Power amplifier stages would drive narrow band filters to a Hi-Q 100% shielded tuner. Keep the passband VERY NARROW!

Power line surges, however, can be accommodated by a combination of filtering and peak voltage limiting.

VHF/UHF radios can be made EMP tolerant simply by designing very robust passband filters. The EMP signals have very little energy above 100 MHZ. Add high quality 95% double shielded coax and Type N connectors from the VHF/UHF antenna. So, good filter design keeps the induced signals away from the rf stages. Add good power and coax line shielding, followed by proper filtering and limiting and you are home free.

If you can do all this for less than several $100,000/radio you might become a successful entrepreneur. :-) :-)

Hi Dave,

Thanks for the prompt reply and generous info. So, are you a Zero Halliburton salesman? Just kidding.

I have about 3 dozen VHF/UHF HT's, many scanners and several mobile xcvrs that I want to protect from an EMP event. I've wondered about paint cans, because of the way they seal. If an HT were to be wrapped in foam, minus battery pack & duckie, and placed inside a new, metal paint can, would that suffice? Would a static safe bag containing the foam wrapped HT with another isolating layer of foam add another layer of protection to the previous method? I've also wondered about making a plywood box large enough to contain all devices and lining it with fine mesh copper screen, with good engagement of the screen at the lid. Worth pursuing?

One of my motorcycles, a big single dual sport, has no electronics that I would consider to be EMP sensitive, except the CDI ignition module. In the event of an EMP occurrence, I'd want to use it to get by all the parked modern vehicles on the roadways to go to a mountaintop location not too far from home to establish simplex comms with others that had taken appropriate precautions. Would wrapping the CDI unit, or maybe a spare, and its wiring in aluminum foil be worth the effort?

Thanks for your time. There is a lot of theory about EMP out there, but I've found little to address the practical issues such as I've presented here.

Paint cans are as good as a Halliburton ... or whatever and much less expensive. NOTE: I use no name aluminum suitcases for my cameras and my station sits on a 'Bingo' type church table. See my QRZ photo.. Both provide a 100% Faraday Shield.

Static Safe? ... I doubt it. The static safe products have very high resistivity as measured as 'sheet resistance'. It's value is the megohm per square which is fine for bleeding off a slow rise time electric charge. EMP induced current transients can easily exceed 1000 amperes. That's a lot of charge to 'bleed-off'.

A mini screen room ... AKA fine mesh shielded six sided enclosure... should be fine. The main leakage is from poor contact around 'the door' or cover in your case. Conducting finger stock is the solution. A box easily can provide 100 dB shielding up to lower UHF frequencies.

Vehicle ignition computers ... well I have never studied how they are built, installed, etc.

A better solution: Solve International problems before the use of EMP type devices, nuclear and non-nuclear, become an "on the table" option. [Even among "terrorists" or other NGO groups]

You can buy surplus 30 cal or 50 cal steel ammo cans at a reasonable price which should be good for storing your HTs. If you want something bigger, I believe that I've seen used rocket launcher containers for sale which should be good for your larger equipment. They're also water proof.

Topic: 19214  Message: 19214

Hi,
I have an ic-706MkIIG with an AH-4 tuner in my car. I use mono band antennas for different bands. I have not run 10m mobile before, and thought I'd try it, now when the conditions are so good. I have not had any problems with tuning the antennas from 80 - 20 m, but the tuner will not tune 10 meters antenna. Very high SWR, and no power out. Is there anyone WHO Can give me a good advice. Buying new tuner Will not be the solution. I love my AH-4

73

What antenna are you using? I used the same rig /ah4 and ran a 40m hamstick
for everything. Tuned fine 80-6

So you're using the ah4 and the appropriate stik for each band?

Larry,

No, I have not tested antennas from other manufacturers, but I have tried the antenna on another car. He has an IC-7000, and a LDG IT-100 tuner.

No problems there.

How about trying bypassing the tuner and see if it works.

Does seem likely to me (and reading between the lines others too polite to mention)
half the reason for decent auto tuner is to use "one bit of wire" for many bands, using a tuner which will have inherent loss for an already resonant antenna is not ideal.

Assuming the antenna and tuner combination offer too much inductance to resonate cleanly on 10 either go the no-tuner route or just try a bit of wire less than a quarter wave at the band.
Stick 7-8ft of copper wire vertical over an insulator and see if it will match that.

I seem to remember they say those tuners need more than X feet to work but extra capacitance to vehicle body could mean it needs less.

Just an idea.

Stu

Before I bought the ah4 I used each appropriate stick per band but after the ah4 install I only used a 40m stick /ah4 for all bands with very good results. I know a tuned antenna is preferred for performance but mobile operation is a compromise anyway. Any particular reason you don't just install one stick and then you're *really* able to utilize your ah4?

That got me thinking and I assume the 40M winding acts as a choke at higher frequencies so only the lower part of the antenna will be radiating, now assuming many people are using mounts low on the body it must cane the efficiency.

Does this make sense, have a nice long first part of the antenna plain stainless rod then a coil roughly similar to (but less than) your 40M and a little whip above that, at lower frequencies the whole thing is singing, go higher up the band the 40M coil cuts off the top but the antenna element is capable of handling a fair amount of current so should be a better radiator?

Easy test would be to use (while stationary) an extension (say 5Ft) put a hamstick for 30M on top then see what can and can't be tuned.

Almost wish I had a truck, oh and roads wide enough to drive it on ;-)

Hi Jan,

Do you have coax or a single insulated wire between the tuner and the whip base?

Have you tried tuning up a plain stainless steel whip rather than a whip loaded for a lower frequency band?

Regards,

Nic

VK2KXN / VK5ZAT

Hi,
I have an ic-706MkIIG with an AH-4 tuner in my car. I use mono band antennas for different bands. I have not run 10m mobile before, and thought I'd try it, now when the conditions are so good. I have not had any problems with tuning the antennas from 80 - 20 m, but the tuner will not tune 10 meters antenna. Very high SWR, and no power out. Is there anyone WHO Can give me a good advice. Buying new tuner Will not be the solution. I love my AH-4

Jan,

Maybe your mounting location or earthing isn't cutting it at that frequency
but is OK on the lower bands.

Regards,

Nic

VK2KXN / VK5ZAT

Larry,

No, I have not tested antennas from other manufacturers, but I have tried
the antenna on another car. He has an IC-7000, and a LDG IT-100 tuner.

No problems there.

Mike,

Yes, that was just what I did, and the antenna worked like it should. This was the core of my question, why I could not send at 10M with tuner connected, while all the other bands worked.

How about trying bypassing the tuner and see if it works.

Before I bought the ah4 I used each appropriate stick per band but after
the ah4 install I only used a 40m stick /ah4 for all bands with very good
results. I know a tuned antenna is preferred for performance but mobile
operation is a compromise anyway. Any particular reason you don't just
install one stick and then you're *really* able to utilize your ah4?

Jan,

I suspect something is wrong with the tuner, possibly an O/C relay contact in the path for little intervention.

That's not so good when you are trying to tune things that are a long way from 50 Ohms (such as tuning a 40 mt hamstick on 80 meters or 100 inches of SS whip on 10 mt) in these instances an insulated wire works best.

Just my $0.02 worth.

Yahoo group: ic706 (2010 — 2015)
Date: 2011-11-04 15:17:37 UTC
From: Larry J. Ford
Topic: 19214  Message: 19235

Remember, the AH-4 is designed to match random wire antennas and "doesn't like" (Technical Engineering term!) antenna lengths are a half-wave or multiple thereof (e.g., full-wave) for any frequency and won't tune it. That is mentioned in the "manual" for the AH-4, and there's an Excel program on the Yahoo Group page for the ICOM tuners group which helps calculate "good" and "bad" lengths.

If you're trying to use a 10 meter antenna on 10 meters, it may just have fallen into the "bad" zone by coincidence. Try adding some wire to the top of the whip with an alligator clip stretched-out like an inverted "L" and see if it tunes then.

Just a thought.

My friend keeps blowing R591, a 4.7 ohm resistor on the PA Board !!Can someone please look at the circuit and identify what this resistor/circuit does??

I've tried with an internet schematic, no success.
Perhaps Bias ??

R591 is a current limiting resistor in the power supply section. It limits the power going to another board, that has the main microprocessor. If it goes open the radio won't turn on.

Here is a link describing the problem and a possable "fix".

My 706MKIIG started not powering up, and this was the problem. It's not an easy fix, the parts are about the size of large grains of salt. If you have not done "surface mount" work before, I would suggest you let a pro with the right tools fix it. (Not an endorsement of the sponser of the link).

I like to have went blind fixing mine :)

Here is the link and good luck!

Actually, there is no reason that the AH-4 won't tune a half wave antenna since it is a Lmatch circuit other than the fact that a halfwave antenna is a voltage fed antenna and the breakdown voltage of the components might be compromised if it does. So Icom probably has the software set so it won't tune a half wave due to that fact. But in reality, and Lmatch circuit will tune a half wave very efficiently !

See page 4 of ICOM AH-4 "manual" (such as it is):

"CALCULATION OF UNDESIRABLE ANTENNA LENGTHS"

(for formula, which won't reproduce here).

AND

Under "Specifications"

". VSWR : 2.0 : 1 or less
(except antennas a half wave or multiple of a half wave in length)"

So, who to believe?

Is TX still on if you disconnect RTTY interface? Maybe rtty interface has shorted PTT.

(on a related note, I found the hard way that a shorted FSK pin means all tone and no diddle....)

Just a quick note, the antenna will only be a quarter wave at one frequency - thats why we use a tuner.

I know what you are saying Larry, but what I mean is that an Lmatch circuit is fully capable of matching the half wave wire, Icom has just got it programmed not to so tuner components (inductor and capacitors) do not arch over and get damaged due to the high voltages present on the half wave antennae. But in actuallity, my AH-4 tunes a half wave just fine. I have an Eagle One vertical which is a quarter wave on 40 meters and a halfwave on 20 and the AH-4 tunes it just fine on 20 - I just reduce the power when using it on 20 meters to protect it from arching. In fact, the AH-4 will tune the Eagle One 10 thru 80 meters just fine.

# 19249. FS: KJ7U Shorty screwdriver antenna

Yahoo group: ic706 (2010 — 2015)
Date: 2011-11-12 06:54:23 UTC
From: vr2xmc
Topic: 19249  Message: 19249

Hello Group,

KJ7U Shorty is a screwdriver antenna. RATED 600 WATTS PEP. Length when retracted 21", when extended 28¡¨. For product details, please visit http://www.kj7u.com/page5.html

I bought it new some years ago but never have a chance to use it. Therefore, it is basically unused except brief test of the functionality of the motor. It comes with all the wiring, control box, a stainless steel whip holder and hard wares from Larry Ant (new price US$487+shipping). My price of antenna + stainless whip holder INCLUDING shipping to major cities in US (quite heavy) is US$359.

Payment by direct deposit to my US bank account or PayPal. Photo available upon request. Please reply off-the-list.

I understand exactly WHY ICOM has published the specification.

Regarding your antenna, have you tuned it on each and every frequency in the 20 meter band? It will be a half-wave on 20 on only one frequency, and not a half-wave on others. In fact, unless it's a stand-alone wire that you can measure exactly, not connected to any other elements that affect length, you don't know the exact length electrically of the antenna. Your Eagle One is not a half-wave through-out the entire 20 meter band.

If your installation works for you, great, but doesn't necessarily prove that the AH-4 will match every half-wave antenna.

Yes, I have tuned it on all the 20 meter band - the AH-4 has no problem tuning it anywhere in the band. The Eagle One is self resonant at 7 mhz ie: <1.5:1 on the entire 40 meter band without a tuner. but near 1:1 at 7.0 mhz, so it is aproximately a half wave at 14.0 mhz.

Had my 706 mobile for 10 years, no problems. Now the rig has gone intermittent. Receiver will sound strange and rig wont transmit. I have checked for loose wires. Sometimes it will heal itself only to go intermittent again. To make this more bizarre, I cannot get the rig to fail on the bench. I get it hot with a hair dryer, beat on it, shake it, keeps on ticking. Have taken it apart and manhandled the circuit boards with it on (carefully). Cannot get it to fail at all.

I think I need a priest. Any ideas?

If it will not fail on the bench, check the wiring to the power source.  The 706 rigs have been known to act funny with low voltage.  Make sure you are getting the full voltage at the rig. Especially under load as when transmitting.

Are you using a remote cable in the car to seperate the head and the rig ?  It may be a bad cable or coroded connectors.

I will check the voltage at the rig in the car, thats a good idea. I do have a separation cable, but have that out of the van on the bench. Cant make it fail but yoinking on it.

Thanks,

I get about 12.2 volts at the connector with van off (looks like I need a new battery), but with the alternator running, it is 14.5 volts. I wouldnt think that is a problem, but maybe it is a problem with the internal voltage regulator in the rig.

Topic: 19252  Message: 19256

I had the exact same problem with mine. After awhile it would fail on and off in the house in the car and on the boat. I sent it in to Scott at MTS and he has had it back 3 times for the same problem ! He has now had the radio for a year and a half and still no joy. He seems to think it is in the PLL but because it is intermittent it is very hard to trouble shoot. All I can say is good luck. If Scott runs it down I will post the findings here.

I get about 12.2 volts at the connector with van off (looks like I need a new battery), but with the alternator running, it is 14.5 volts. I wouldnt think that is a problem, but maybe it is a problem with the internal voltage regulator in the rig.

I can verify that an ICOM IC-706 MKII will "act funny" when transmitting with low voltage.

Last Friday afternoon, I was putting finishing touches on a new portable HF NVIS antenna [1] to deploy Saturday in support of the Duncan Ridge Trail 50K trail run through the Chattahoochee National Forest in North Georgia.

I had another ARES EC in a neighboring county about 35 miles away standing-by to check the NVIS transmission (there's a 5000 foot mountain ridge, one of several, between the two of us, so there wouldn't be any ground wave at work).

To quickly power-up the 706 out in the back yard, I grabbed a 35-amp/hour GIL sealed aviation battery that my brother had given me that I keep on a trickle charger just for the heck of it. He gave me the battery because it wouldn't hold a charge to his satisfaction (possible dead cell). I grabbed it because it was closest to where I had set-up

When I fired-up the 706, and started transmitting to my friend, he immediately came back with a report that my audio was very distorted. I could hear him just fine. After several more attempts, and after checking all other possibilities, on a hunch, I disconnected the GIL battery, and got my deep-cycle 85 amp/hour marine battery that I normally use in the field and which I also keep charged. I connected the marine battery, transmitted again, and voila` now the other station is reporting a solid signal and "arm chair copy" on the audio.

I put a VOM on the aviation battery, and it was reading around 11.8 VDC as I recall, after only 15 minutes off the trickle charger.

The 706 MKII definitely does not like a power source under 12 VDC, and a distorted signal will likely result.

Larry J. Ford
KG4GPJ

[1] Incorporating an ICOM AH-4 autotuner, in a portable, "one-man" deploy arrangement, but I'll save those details for the ICOM Tuner and the NVIS listserves.

If it will not fail on the bench, check the wiring to the power source. The 706 rigs have been known to act funny with low voltage. Make sure you are getting the full voltage at the rig. Especially under load as when transmitting.

Are you using a remote cable in the car to seperate the head and the rig ? It may be a bad cable or coroded connectors.

Had my 706 mobile for 10 years, no problems. Now the rig has gone intermittent. Receiver will sound strange and rig wont transmit. I have checked for loose wires. Sometimes it will heal itself only to go intermittent again. To make this more bizarre, I cannot get the rig to fail on the bench. I get it hot with a hair dryer, beat on it, shake it, keeps on ticking. Have taken it apart and manhandled the circuit boards with it on (carefully). Cannot get it to fail at all.

I think I need a priest. Any ideas?

The only "mobile" HF rig that Kenwood makes currently that I'm aware of the TS-480SAT or TS-480HX (200 watts).

One of my Elmers bought a new TS-480SAT earlier this year, didn't like it at all, and recently sold it. (In the past, he has owned and operated IC-706s, IC-7000s, and TS-50s in mobile installations.)

Granted, that's a sample of only one, but that rig may not be all it's cracked-up to be; I'd see if I could find one to demonstrate, play with, etc., before taking the plunge.

Thanks Larry. I appreciate the info. I have one friend that has the Kenwood and he likes it. He is weird though, and your friend may be right. Its hard to replace the 706, its like losing an old friend. I have a van and have half a mind to strap my 746 between the seats. I see yaesu has a new smaller radio that has a mobile bracket, the FT450. I had an 857 and wanted to throw it out the window is was so hard to use.

From: n4eyz
Topic: 19265  Message: 19265

I see several of these cables listed on Ebay for pretty low prices. Do they work ok? Any recommendations?

Never tried controlling my 706G w/computer--is it worthwhile?

Topic: 19265  Message: 19266

I have a homebrew one so i cant comment on the ones sold on ebay, but it is very worthwhile having the radio tied in witht the computer. If you do computer logging the mode and freq are automaticly in the log correctly. This makes the log correct and that is a good thing especially for the LOTW user.
I only use my 706 occasionally for portable ops but it is still a good feature.

I use a KawaMall (or something like that) usb device that I got of from eBay to control my 706MKII with HRD. It works like a charm for me. YMMV. I use the same device with my 703+ using HRD again. Again, it works like a charm. The only issue I have (and it's with me anyway) is that I plug the phono plug in the wrong hole on my 706MKII. I keep telling myself I just need to buy another one for the 703+. Then again, I should try it with my 735 to see if it works there too. Then I'll need to buy 2 more just to make life easy.

From: Dave Wright
Topic: 19265  Message: 19268

I have the 706Mk2

I bought one of the 3 dollar cables from Hong Kong. It's the Prolific chipset, but it doesnt like HRD, so I use it with fldrig. But then again, the radio is at arms reach so I manually change it. It's nice to set up the memories using the USB, but actually controlling, since its so close its easier to do it by hand. Plus, the laptop is the family one, so plugging and unplugging will take its toll. If I had a dedicated PC that would be different.

Just my 2 cents worth

I bought mine from e2wholesale in China,,,,got the little CD with the USB drivers...loaded it and it worked fine on HRD and my 706MKIIG and a Dell D620. All those cables MUST be from the same manufacturer...I built a serial interface before that and its works good too..

I appreciate all the responses. I wasn't sure if the $10 and under cables were worth buying. I ordered one so I'll give it a try. I'm not a heavy operator but thought I'd see what it's like. I have an older Dell desktop that I thought I'd dedicate to radio stuff, psk and so on. Besides I love toys!

Phil, when you measured the voltage, were you taking the reading from inside the rig? A common problem with the 706 is that the female contacts in the power connector tend to loosen up over time, so you need to check and see what the voltage is inside the rig when you are transmitting (FM or CW).

Regards,
Ed

These posts caught my own curiosity. I see that there are RS232 ones and USB ones. I have an adapter to RS-232, but it seems easier/simpler to just go with the USB ones. Am I missing something? Would i need special driver software?

Kevin,

Basically the USB versions have the USB-to-Serial converter built into
them. So, you will still need drivers and it sets up a virtual com port on
your workstation.

Sorry I'm a bit late getting back to you Wayne as I see you have ordered one. I've had a couple. The first one failed as the line was too short and it could not endure my wife's putting cable ends away. I use them land mobile. After the third repair the pcb was degrading! The cable on the second one I got was longer, and I reinforced the cheap construction of the USB connector, so it has lasted better. Another option would have been to use a USB extension cable.

My rig is a bit difficult to access easily, so automatic frequency setting is a real plus!

Thanks Bob,
I think the one I ordered is 1m in length, already I'm seeing potential issues with that but if I do I can do as you suggest. Thanks for the reply!

# 19276. Re: [ic706] Re: Icom CI-V USB interface cables

Yahoo group: ic706 (2010 — 2015)
Date: 2011-11-24 11:59:25 UTC
From: Stu Capon
Topic: 19265  Message: 19276

I got mine from http://www.g4zlp.co.uk/unified/IcomCAT.shtml, trusted
that more than ebay unknown chipset types I considered.
The USB dongle can go on an USB extension lead with the usual USB
limitation 5M Passive (without additional repeater or hub).
The lead from the dongle to the radio is detachable (read replaceable)
3.5mm jack at both ends (one two contact plug, the other three contact)
and I believe the limitation for CIV is also 5M.

This assumes you are not seeing a lot of RF about obviously.
The advantage of the detachable lead is also if you did want to put
solid ferrite suppression on then it's an easier lead to re terminate
than USB.

Dongle itself was a small PCB inside shrink tube so again maybe possible
to fix (don't quote me) just not as pretty as some "Use once and give
up" chip in smooth moulded form.

Regards
Stu

I have used the
1)One-Touch USB cable,
2)One-Touch serial cable as RS-232,
3)and using the Serial to USB cable that came with RigBlaster(?)
nomic version with the One-Touch serial cable.
4)WestMountains RIGtalk CAT CIV interface.

For the uniniated the One-Touch is a glucose meter that allows computer downloads of recorded readings.

All have/do work quite well. You WILL need to make a stereo to mono adapter to use the One-Touch cables. (Check ur junk box for parts)

Have used with 706mk3 and R-75

One thing that intrigues me about the
857 is when useing the atas screwdriver it will auto adjust they say to the correct length. That would be nice. The atas I don't think is too robust. My friend in England that has the setup is leery of the atas at highway speeds. Can you accomplish that yet with aftermarket screwdrivers? That would be a great step forward with rigs with tune buttons.

Topic: 19252  Message: 19280

A Tarheel antenna combined with a Turbo Tuner is the ticket. I'm using a Little Tarheel II and a Turbo Tuner with my IC-706MKIIG. Bring up a freq and hit the Tune button and it does the rest. Been using it a year and a half now with no problems at interstate speeds.

An alternate (and cheaper) method is to get a Better RF tune control. You can use the Tarheel up and down control to move the antenna to Peak for noise on the radio, then hit the tune button and move the antenna up and down to dip SWR.

Friend of mine went from a Yeasu rig/ATAS combo to a Tarheel and Turbo Tuner due to problems he had with the ATAS not tuning up easily or properly.

Hope this helps

This was measured at the connector itself. I am beginning to think this is a capacitor problem that only shows with higher voltages. There is a long thread on eham (that was copied here) about C188 and C604, 2 16V electrolytics. I can see if one of these is becoming a semiconductor with higher than bench supply, I would have a problem. What makes this hard is that it is intermittent. Cant make it happen when I have a meter in my hand.

--- In ic706@yahoogroups.com, "EdwinB" <n5kzw@...> wrote:
>
> Phil, when you measured the voltage, were you taking the reading from inside the rig? A common problem with the 706 is that the female contacts in the power connector tend to loosen up over time, so you need to check and see what the voltage is inside the rig when you are transmitting (FM or CW).

I had the same problem, found out that the power plug was
bad, the sleeves in the plug has widened and were not
making contact. I pinched them together and the problem went
away.

I do agree that if anyone can find a problem it is Scott at MTS,
I have had my 706MKIIG and 706 and a few ICOM VHF radios repaired
by him, he is cheap, knows his stuff and great to deal with. I
have had a number of friends send radios to Scott and they all
say the same thing, for ICOM and Kenwood repair he is the go to
guy.

What's the contact info for Scott at MTS? I have a Kenwood dual band mobile rig that may need service.

For ICOM rigs, I've had great service with Matt Adrian at ICOM Service Center - Michigan; very efficient and reasonable cost service. http://www.sarts1.com

From: John Geiger
Topic: 14205  Message: 19287

Hi Arthur,

All of the 706 models have 6 meters and 2 meters included. The MKIIG also has 70cm. None of the models come with a built in tuner.

Assuming the rig is in decent condition and comes with a mic and power cord, typical prices would be:

706 original $375 to $400
706MKII $425 without DSP included
706MKII $450 to $475 with DSP
706MKIIG $600 or so.

Of course having the optional filters with it increases the price. Figure $50 for each extra filter.

Also take a look at past auctions/sales on eBay, and on ham radio classified websites like QTH.COM for asking prices.

Also the power output level on 2 meters varied with the models:

"Original" 706 - 10 watts;
706MKII - 20 watts;
706MKIIG - 45 or 50 watts (not sure).

Finally, the original 706 will not "control" an AH-4 autotuner for tuning on 6 meters; however, the MKII and MKIIG did have the additional circuitry, firmware, etc., to "command" the AH-4 to tune on 6 meters by pressing the "Tune" button on the front of the rig.

I have both an original 706 (still in mint condition, by the way) and a MKII with DSP and the MARS/CAP mod. I paid $500.00 for it about 2 years ago, and it included the mobile mounts and separation kit.

There were a couple on eBay as of yesterday, but the usual cautions apply.

Also take a look at QTH.COM classifieds, which is a mostly "ham-to-ham" marketplace, and perhaps a bit more "trustworthy" than eBay.

Good luck.

Hello, my name is Joe - ve7lsb
I have only made a few contacts ( fairly new to amateur radio)

recently i purchased a icom 706 mk2 (used)

Now I am not very good with understanding my icom 706 and was hoping someone could help me.

I want to do check ins with local nets (20 meter) but when I go to transmit, a 144.000 mhz (2 meter frq is displayed) .......perhaps someones old saved settings? I dont know myself.

Can someone please tell me whats happening and how to just have the radio transmit on the same frequency as I am recieving?

Sorry but i am old school and dont understand whats going on

thanks for your patients

73 Joe - ve7lsb

I use the Radio Shack Scanner Programming Cable and the TRS to TR
adapter that comes with it.
I found this on the IC-7000 forum and it works fine on the IC-706-MKIIg too.
I have tried XP and 7 on several different model computers and run
mainly HRD but have never had a problem with anything else I tried.

You just have to get over the surprise of actually buying something for
your radio at Radio Shack.

Hi Joe,

Welcome to the hobby. Sounds like you have the duplex or split feature on. On the M1 menu you should see

SPL A/B A=B

If the SPL is in bold, push the F-1 buttton to turn it off. It should then transmit and receive on the same frequency.

Hope this helps.

Subject: [ic706] new to amateur radio

Hello, my name is Joe - ve7lsb
I have only made a few contacts ( fairly new to amateur radio)

recently i purchased a icom 706 mk2 (used)

Now I am not very good with understanding my icom 706 and was hoping someone could help me.

I want to do check ins with local nets (20 meter) but when I go to transmit, a 144.000 mhz (2 meter frq is displayed) .......perhaps someones old saved settings? I dont know myself.

Can someone please tell me whats happening and how to just have the radio transmit on the same frequency as I am recieving?

Sorry but i am old school and dont understand whats going on

thanks for your patients

73 Joe - ve7lsb

Hey Joe: That same thing happens to me all the time, when I'm on 6mt. & go to HF, before I switch to HF. I make sure I'm on a simplex channel, other wise it will transmitt the 6mt. offset, hope the helps, Merv ka8pgw

The "split" function under M1 must be on.

Perhaps a " CPU reset" to return all functions and values back to factory default settings would be in order to clear the prior owner's settings.

See manual page 17.

# 19298. 706MKIIG Intermittent relay clatter on HF receive only - Help please :)

Yahoo group: ic706 (2010 — 2015)
Date: 2011-12-05 21:45:26 UTC
From: ekeppel
Topic: 19298  Message: 19298

Hi folks! First post here.

I have an IC-706MKIIG that I bought used, and it worked ok for the first few days, but before long it was locking up on me intermittently and had to pull the power to get it powered on again.

I have a feeling that is due to heat buildup somewhere on some component, and possibly unrelated to main main issue making the radio nearly unusable on HF, but I wanted to mention it in conjunction with this relay issue...

When I switch to any HF band, one or more of the relays on the filter board begin to chatter. Sometimes just a bit but most times rapid-fire random chattering. When this happens, I lose RX on that band unless the relay chattering stops in just the right place. I can't tell which relay it is cause they are so small and don't click enough for me to feel which one is clicking when it happens.

TX appears to be fine, just receive is affected. I am thinking it may be related to Q1 on the filter board near the RL1 relay, but I don't know enough about this to test it or diagnose from here.

My power supply was tested and is operating well, 13.8V and holding under load, so I have rules out power input issues. I have also checked and reseated all ribbon cables, as well as loosened and re-tightened all the screws that hold the filter board to the chassis.

I have found by trial and error that I can get the relay in question to click when switching power between 'L' to '1' on the Q1 menu. When in the L position, the relay clicking is usually better, but it comes in rapid fire after a time there as well usually.

Any help diagnosing this would be greatly appreciated.

Thanks!

--Eric

Have you tried tightening the power connector tabs as recently mentioned here?
The fact that it transmits ok is an indicator that they are ok, but its worth checking....

Joe,

I just uploaded the latest rev8 of my paper describing Duplex and Split for the 706 MkII G.
I am pretty sure it is the same for the earlier version Mk II.
I hope you find it useful in understanding the fundamentals.

It's about half way down in the Files Area:

IC-706MkIIG Split and Duplex rev8.pdf

You comments welcome if you think there are areas that need clearer explanations.

Adrian, I guess my reply didn't show up here, but I wanted to reply publicly to let everyone know that I did check that as well, and the molex connector is good and tight.

It is an aftermarket one that I wired myself, and have used with other radios just fine.

Still no luck figuring out what is wrong with the rig.. anyone have further suggestions?

Thanks and 73,

Eric

Eric, the Molex issue is not on the power cord side of the connection, it is on the radio side. The female contacts in the connector in the radio are the ones that need to be tightened.

Regards,
Ed

Roger that Ed... Thanks for the clarification. I will give those connections a good check over. While I'm at it, I was told by a tech (via e-mail) that a final was shorted and this was the cause of the relay clicking.

My radio puts out just fine on all bands and the power is adjustable. I tested with a dummy load, so can someone explain how that could be the case? I am scratching my head over that.

Thanks all -- 73,
Eric

# 19305. 13VDC not available at tuner connector

Yahoo group: ic706 (2010 — 2015)
Date: 2011-12-10 23:01:51 UTC
From: Philip
Topic: 19305  Message: 19305

Hi everyone,

I have a naive question that I haven't managed to answer searching this group or google.

My 706 MkII doesn't have 13 VDC at the tuner connector. It is decade old problem... one I have not tried to fix. Now, I would like to use an AH-4. I suspect the problem is a blown trace on the PA board (as described and resolved in http://groups.yahoo.com/group/ic706/message/18654) but I hesitate to tear that far into my radio.

With the radio switched on, the 13 VDC pin has 0 V, Gnd has 0 V, Start has 0 V, and Key has about 5 V. These are all with respect to the chassis.

With the radio switched off, however, Gnd does not appear to be chassis ground; there is about 20 KOhms resistance between the chassis and the Gnd pin.

So, here is my naive question: I wonder if I can't find 13 VDC elsewhere in the radio. For instance, on the fused side of the 4A fuse. That appears to be 13 VDC against chassis ground. What is the downside of using that 13 VDC, by placing a jumper from there to the 13 VDC pin of the tuner connector?

I suspect there is an excellent reason to NOT do this, otherwise it would have been recommended before. (Or have I just failed to find the proper search terms?)

Thanks,
Phil

From what I recall of the 706 MKII, it has a fuse in the tuner power line.
It only provides a few hundred mA and would be easy to blow.

From: Larry J. Ford
Topic: 19305  Message: 19307

Good point.

The specs for the AH-4 say it is rated for 13.8 VDC +- 15% with "... current drain less than 1 A"

Someone posted, I believe, about "jumpering" the 4-pin tuner port DC pin from another 13.8 VDC source in the rig since the tuner port DC supply was not working. If that line was not similarly fused, then I guess it's possible the tuner could draw more current than it's rated for, unless there's internal fusing in the AH-4 to limit the current.

Does anyone know if that is the case with the AH-4?

(This is being cross-posted to the ICOM Tuner list.)

Larry there is not an internal fuse in the ah-4 there is a fuse holder in the radio at the back that has a 1A fuse in it for that circuit.

Jack,

Thanks for the info. Sounds like "jumpering" the rig's tuner port DC line so as to bypass that fuse wouldn't be a good idea.

I looked at the power input on the schematic of the AH-4 in the Service Manual PDF I have, and couldn't, as you say, clearly ID a fuse. Unless there's an internal limiting resistor or the like internal to the AH-4, it may be relying on that fuse in the rig for current limiting, at least to my technically-limited mind.

there is current limiting in the AH4 but do not bypass the fuse it is the only one to that port and it powers all 3 ports the TUNER port, the ACC port, and Port2

BTW I lost who has the problem, I am located in North Carolina if you need some one that can do board work please contact me

Topic: 19305  Message: 19311

Thanks for the information. I think I am being moderated because I'm new to the list, so my responses may not seem timely.

If there is a 1A fuse in the 706MKII, it is not mentioned in the user manual,and I can't find it in the service manual. Where is it? I maen I'd love to find a blown fuse rather than a blown trace.

Thanks,
Phil

Larry and Kurt,

Thanks for your interest. I believe that tuner power connector is not protected by a replacable fuse. As far as I can tell from the user manual and the service manual, there is one replacable fuse inside the 706 MkII, and that is a 4 A fuse which protects the entire radio except the PA.

I also believe that the AH-4 has no internal fuse.

A blown trace on the PA board where 13VDC is supplied to the tuner connector seems to be a known failure mode. If you are interested, please see the thread I cited earlier.

I have little interest in removing the PA board to repair that trace, if I can avoid it. My proposal was to find 13 VDC elsewhere inside the radio, and jumper that to the 13VDC tuner connector. I suspect that 13 VDC with sufficient current capacity is available on the protected end of the 4 A fuse that protects the rest of the radio.

I agree that it would be wise to protect that jumper with a 1 A fuse, if I can find room for it under the radio's cover.

Any guidance is welcome.

Thanks,
Phil

I had this happen when a connected accessory cable shorted and fried the trace in the transceiver.

> I have little interest in removing the PA board to repair that trace,

Mine was visible/repairable from the component side. I did not have to remove the PA board. It would be a simple matter to remove the cover and inspect yours to determine if it's readily repairable or not. It's not hard to locate, just follow the soot.

Why bother with a fuse when you can use a board trace? :-)

I can't find that 1A fuse. My radio is the MkII, no G. The only fuses I find are a 4A fuse on the PA board, and of course the 30A fuse in external power line. If there is a 1A fuse lurking in there, I'd sure like to know. I'd rather replace the fuse than tinker around screwing things up.

Thanks,
Phil

Mark,

I've had the radio open and examined the where the tuner connector connects to the PA board. I don't see any obvious damage... certainly no soot. I was guessing that the damage was on the underside of the board, but I'm not sure. You mentioned an accessory cable. Was your problem with the accessory connector or the tuner connector? Also, my radio is the MkII. Is yours a MkIIG?

Thanks,
Phil

Dang, wish I hadn't lost track of my manual...

I had a concern when I hooked up my SGC tuner. From what I recall, the tuner port is protected by an internal 1A fuse.

Unnfortunately there is no fuse on that tuner port, and it is very easy to blow the tiny trace - I've done it. And it is also difficult to repair, but it can be done with care - again, I've done it.

# 19319. IC706mk2G Firmware Reload

Yahoo group: ic706 (2010 — 2015)
Date: 2011-12-14 04:31:20 UTC
From: Bob
Topic: 19319  Message: 19319

Has anyone reloaded or updated the firmware in an IC706mk2G? We have two radios where the TUNE button will not activate the AH4 antenna tuner. All other functions of the radio appear to work ok.
All voltages and circuitry to and including the 4 pin socket have been checked ok. The tuner works fine with another radio.It would appear that there is a problem with the processor on the main board. Any help would be appreciated. Bob ZL2RP.

I recall the actual trace that opened up was closer to the center of the PA board, not immediately adjacent to the tuner connector.

> I don't see any obvious damage... certainly no soot.

Mine went in a spectacular way. At the time I had no idea what was happening as everything seemed to be operating normally, while the car smelled like burning electronics.

> I was guessing that the damage was on the underside of the board,
> but I'm not sure.

This isn't rocket science. Get the service docs for your version of PWB and trace the thing out. If you find that the trace is open somewhere inaccessible, just put a jumper in where you can. For extra credit, make the jumper a 1 amp picofuse.

> Was your problem with the accessory connector or the tuner
> connector?

Tuner. I was using the 12V from there to operate my screwdriver antenna (under 1 amp). The cable got crushed under the vehicle and shorted out.

> my radio is the MkII. Is yours a MkIIG?

MkIIG.

Hi, the switches referred to apear to be only in the AT-180 tuner, I do not have one to try, my problems are with the AH-4 tuner which uses a different port into the radio.

Methinks an owner performed 706 firmware upgrade involves special concoctions of rare and esoteric transistors, diodes and IC's, mixed up together in a simmering black pot of circuit etching solution. The 706 owner then dips his 706 in the bubbling mass and recites the Icom POA (Pledge of Allegiance).

That's all there is to it! (plus a check to Icom for $200)

Use liquid neverdull on the plastic to remove scratches. Put the blue painters tape over the printing so you don't remove the 706 from above the display. It will take some time depending on how deep the scratches are...it will amaze you. It will eventually look new. JP

Date: 2011-12-20 20:29:28 UTC
From: Ralph
Topic: 19335  Message: 19335

I have an Icom 706MK2G and everything seems to be ok on the frequency except the FM receive. I am sure my test set is ok as it is an HP 8924C and WWV at 20 mhz is right on frequency.

The transmitt frequency on FM is 200hz or less. The best 12 db sinad for FM is about 2 KHz off frequency. That is at 146 MHz.
The SSB,CW, and RTTY all seem to be off set the correct ammount on receive.

Is there a seperate adjustment for the FM receive only ?

The so called service manual that I downloaded does not seem to mention it.

Subject: EXTERNAL: [ic706] Hints on reducing current drain for portable use

Does anyone have ideas on how to reduce the current drain used by the IC706 when using it "backpack mobile?"

I have turned off the backlight display and set the CW mode to full break-in (0 sec. Delay). Any other hints? I will be running 3 watts CW QRP. Using a gel cell and want to keep weight down batterywise.

My rig is an original IC706. Serial no. 6xxx.

Thanks for any suggestions you may have.

Joe N8TI.

You might try the hf pack group or even the 703 group might have more experience in this subject.

The 706 was not really designed for QRP operations, and draws far too much current, even when not transmitting (almost 2 amps on receive, according to the manual).

A friend trying operating QRP from the floor of the Grand Canyon using CW, and, I believe, a 7 or 8 AH gel cell battery, which he intended to recharge with a portable solar panel. The 706 just drained the battery too quickly, severely limiting his operating time, and challenging the ability of the solar panel to recharge the battery. As a very experienced operator, I'm sure he did all the tricks you've mentioned to cut down on current drain.

On his next deployment (he's with the US Fish & Wildlife Division, and gets assigned to 2-week stints down in the Grand Canyon to survey fish populations in the Colorado River), he took a rig designed for QRP operations, a Yaesu 817-ND (which he conveniently won at a hamfest!).

The 706 is a great rig (I have two, and "original" 706, and a 706MKII), but not very well suited to QRP operations, IMHO.

Hi Larry,

I think you mean suited to QRP portable operations. Works fine as a QRP rig in the shack. You can turn the power down to 2 or 3 watts, and have a blast. I have probably worked 15 or 20 countries on QRP in the past few months with mine, although I usually run it at QRO (100 watts). How does the MKII compare with the original? It is a huge step up? I have the original and really like it.

Well, I got it down to 1.15 amps on receive. I have not tried the pre-amp trick yet, so that's not too bad. Puts out three watts on transmit, drawing about 6 amps.

Hi gang, has anyone ever run across a situation where a 706 (original flavor in my case) turns on but there may not be any audio forthcoming till a few seconds/minutes after turn on? The rig will tx and has rx activity on the smeter but no sound. After the audio comes around the rig operates normally. Any help appreciated,

Chris

Turning off preamp got receive current drain down to 1.085 amps. Radio uses .05 amps when turned off.

I agree that the current draw is too high for an extended portable operation, but I believe it should last a couple of hours using QRP CW with CW transmitting about 10% of time. The FT 817 draws about .4 or .5 amps on receive. That difference would be important even if you wanted to use the rig for more than three or four hours.

The LDG antenna tuner and the rig draw a surge of about 1.6 amps at start up for about 2 seconds, then settle down.

Any other thoughts would be appreciated. Probably a battery booster would be a good thing or some form of solar panel if one was available to make up the difference.

Joe

The preamp makes a big 20 ma differance.  Mostly the drain of the LED.

One thing not mentioned and I have not tried it, but it is reported that the 706 does not transmitt well if the voltage is somewhat low.  YOu may want to run some tests with the batteries near the end of charge voltage.

As others have mentioned, the 706 is not a good rig to run portable off batteries.

Well, I still believe it wasn't designed for true QRP, whether in the shack or not, and definitely NOT designed for portable, battery-powered QRP operations.

It simply does not compare to purpose-designed, QRP rigs like the Yaesu 871 or even the 703. Of course, you can turn the power down to 5 watts or less and use it (probably still draws more current than that a true QRP rig on 5 watts), and I've done it a lot on 60 meters, but that, in and of itself, does not make it a "QRP-designed" rig.

Heck, I can turn my 7200 down to 5 watts or less, and it still doesn't make it a "QRP" rig in the strict sense.

The big differences between the "original" 706 and the 706MKII (that I can discern) are;

1. 20 watts on two meters for the MKII vs. 10 for the 706;
2. The MKII will command the AH-4 autotuner to tune on 6 meters, whereas the 706 cannot.
3. You can add the "AF" DSP module to the MKII, but not the 706. [1]
4. The MKII will accept two filters, not just one like the 706.

Larry J. Ford
KG4GPJ

[1] The "AF" based DSP in the MKII pales in comparison to true "IF" DSP in the 7200 and other ICOM models. Of course, it's a couple of generations later technology than the late '90s DSP technology.

Not exactly. If the battery is big enough, it runs fine off batteries in the field, and I've done it a number of times. Of course, I'm using at least a 75 AH marine battery and I don't expect a full 100 watts output.

Anywhere from 20 to 75 watts generally works fine for the HF NVIS deployments I use it for, and the battery will do that all day long.

Ldg tuner. Some ldg tuners have the ability to go self powered providing you install the AA pack. I believe it's latching relays that require no dc power after tune which is what you want.

With regard to using the 706 for QRP Portable use, I was just doing the "use what you got" thing. As I was planning to go outside and set up on a picnic table in a park or a rest area and would only need a few hours of operation, I figured that using the rig I have is better than spending $650 on a new rig or not going at all. Plus, that 706 has served me well. Took it to Costa Rica in the 90's and it worked without a hitch. Sort of become attached to it.

I am going to test it with the battery on Straight Key Night and will see how long it lasts. I saw where 7 amh batteries cost about $20 delivered, so I can always have two and lug the extra five pounds.

Another rig I would like to try portable is my FT-101. Maybe hook that up to a tractor battery and do some portable AM. Half the fun is figuring out how to do it, after all.

I have probably worked 15 or 20 countries on QRP in the past few months with mine, although I usually run it at QRO (100 watts). How does the MKII compare with the original? It is a huge step up? I have the original and really like it.

On occasion I use my 706 portable with a 7Ah gel, running 5W out CW. The rig draws what has been reported here, and amp and change on RX, and about 6A on transmit. Contrast that with my QRP rigs, which draw less on 5W transmit than the 706 does on receive, and it's not hard to decide it's not the optimum choice for backpack operation. It's self defeating to have to carry large batteries to run a power hungry radio.

But I get the "run what ya brung" thing, and I can attest it's certainly doable. With probably a 20/80 duty cycle I get at least an hour out of a 7Ah gel before the rig gives up due to low voltage. That doesn't give you much in terms of operating time especially if you had to hike the thing in any appreciable distance. If it's operating in a park or whatever, larger or more batteries are an option, or better yet plug directly into the car.

Happy new Year all,

I have used my 706 original for portable use at the 100W level.
As RX is about 80 to 90% of duty cycle for me that is the power budget.
You can drain an aging car battery overnight.
The minimum current drain on RX is about 1 amp with the back light off.
A 75AH gellcell on a trolley works well but is getting heavier each year.
A 40w solar panel can keep a smaller 20AH gell battery going as it will cover the RX current.
The latest is a 20AH LiFePo battery. Lighter smaller and possibly cheaper.
http://www.evpower.com.au/-12V-LiFePO4-Batteries-.html
This holds the Volts up to the end but needs a cutout at 11V. No sag at 20A either.
The 706 is more tolerant of low voltage than my FT100.

Andrew

Well, here is what happened when I used the 7amh battery on CW:

I called CQ for a while at 3 watts and was not getting any takers, so I cranked the 706 up to 30 watts or so. It could have been more, as I had it at power level 5, but I was relying on the led's on the tuner. It was drawing about 10 amps at that output. I immediately got a reply and had a ten minute conversation, maybe a little longer.

After that I just left the radio on and waited for it to die. It shut off for lack of power after a little over 2 1/2 hours from turn on.

So, I was happy that it worked at power level 5 with the one battery. But, any sort of high power operation would not really work with just the 7 amh battery.
I believe that two batteries would allow me a three hour portable operation even at power level 5, which is what I was looking for. Amazon was selling the batteries for $18.00 delivered, so I ordered one. I will be working portable next weekend and will see how it actually does in the field.

The real question is what voltage reading did you discharge the battery down to?

Most batteries specify a certain voltage (10.5 v?) not to discharge below. Damage to the battery supposedly occurs if discharged below that voltage.

Of course, the 706 should shut-off before that critical voltage is reached.

73,

Larry J. Ford

My 5 year old 706 will no longer transmit when depressing PTT on the mic. There is no voice but is possibly a minor buzz. Also there is no indication on the screeen of any transmission. The mic works on a friend's 706. Receive is normal. I am able to send data via my pactor modem. Any thoughts to help me resolve this would be appreciated.
Peter

The 706 shut off at about 10.5 volts. So, I guess I can run it until it shuts off.

It really is a pretty nice rig once you learn all of the menus.

Power level "L" is 3 watts out on mine and level "1" is 5 watts out. So, gives a little flexibility for QRP work.

Joe.

To eliminate the battery voltage going to low and to protect the batteries, at the cost of a few mils of current, I use an ELK 965 battery cut-off. The ELK 965 was made to be used with 12v alarm panels so that during a power failure it would disc the batteries (4 to 7 AH) from the load on low voltage rather than ruining the batteries from completely discharging them. I had to install a N.O. push button switch from the load + to the Battery + (to jump start) to make the unit think the ac was restored for it to work and connect the load to the battery. In normal operation the path to charge & connect the batteries to the load was completed when the ac was restored to the alarm panel. During portable use there is no AC power. If you feel the need for more current, have the load out operate a relay with the required current rated contacts to transfer the increased battery load.

> it until it shuts off.

Right. The issue you'll run into though is there will be a point in the state of charge where you're above the voltage threshold for receive, but due to the increased current during transmit, the voltage will fall below the minimum threshold.

An expanded scale or digital voltmeter can fairly accurately show you when you've reached this point at your nominal operating currents.

Or, just key up and if it shuts off, you're already there. :-)

> To eliminate the battery voltage going to low and to protect the batteries, at the cost of a few mils of current, I use an ELK 965 battery cut-off. The ELK 965 was made to be used with 12v alarm panels so that during a power failure it would disc the batteries (4 to 7 AH) from the load on low voltage rather than ruining the batteries from completely discharging them. I had to install a N.O. push button switch from the load + to the Battery + (to jump start) to make the unit think the ac was restored for it to work and connect the load to the battery. In normal operation the path to charge & connect the batteries to the load was completed when the ac was restored to the alarm panel. During portable use there is no AC power. If you feel the need for more current, have the load out operate a relay with the required current rated contacts to transfer the increased battery load.

From: Facility 406 DM09
Topic: 19356  Message: 19361

Your test indicates the microphone and radio are OK, but the connection between the two, the plug on your radio is suspect. Does the original 706 have a mic jack in the rear (I have the MKII and MKIIg)? If so, try that, if OK, then the jack on the face is bad/damaged.

I don't know about the "Elk 965," but the MFJ-4416B "battery booster" has a user selectable battery voltage cut-off that will kill the device (and power to the rig) when battery voltage drops to one of three selectable voltage levels:

"There are also selectable limits on the minimum voltage that the unit will accept: 9-volts, 10-volts (default), and 11-volts. This protects you from over-discharging a battery and possibly damaging it. MFJ-4416 also includes output over-voltage crow-bar protection should regulation be lost."

I have the MFJ-4416B, but have yet to use it in a field environment, as the Wal-Mart 75 AH marine battery has provided sufficient voltage for my 706 in roughly a half-dozen field deployments over the past 3 years. Next time out, I may have to hook-up the MFJ-4416B just to see how it does.

Kurt you are absolutely correct, I am now able to get out as clear as ever. Somehow I need to get this repaired but probably won't be able to until I return from the Caribbean.
Now that I have an interested party though, any thoughts as to why on 20 metres my radio shuts off using full power but at 50 or 60% it works fine. It does not shut off at 60 or 80 meters on full power. I am a maritime mobile. Should I start a new thread?

"Kurt you are absolutely correct, I am now able to get out as clear as ever."

I was thinking about your problem, I wonder if there is some debris in the connection on the radio? Possibly something on the plug on the end of the mic cord and got shoved into the connection, or something fell into the connection and got mashed when you put in the mic. Inspect it closely, use a light, see if you see anything. Myself, I would CAREFULLY, so as to not snag the pins, use a q-tip moistened with rubbing alcohol and wipe off the pins in the connector, same on the mic side. These are gold plated, so you won't have oxidation problems, primarily debris, secondly, mechanical damage from a hard object getting jammed inside. Be careful not to push down on the pins on the radio side and make them loose if you do this.

"Now that I have an interested party though, any thoughts as to why on 20 metres my radio shuts off using full power but at 50 or 60% it works fine. It does not shut off at 60 or 80 meters on full power."

I can't comment on the 60m or 80m problem just yet, but I did have a 706 series that shut down many times while in an exciting QSO on 20m!

The 706 series has a notoriously bad power connector, regardless of the model or year made. On the radio side you have a 6-pin Molex type connector. I say type, because it's not a Molex, it just looks like one. I checked with Molex when the 706 came out and for several years during production, they did not have such a connector, although they MIGHT now...

On the radio side is the pins or male side of the connection, on the cable side the female part of the connection.

The female side is a rolled piece of flat stock. It is open along the edge. Due to both mechanical and thermal forces, the female side opens up. Instead of 100% of the intended surface area making contact, it becomes less and less with connecting and disconnecting, which results in more current through a smaller surface area, which results in heat, resulting in more expansion, resulting in fatigue and at times arcing and oxidation. This results in loss of voltage and current feeding the radio. When receiving, it is OK (when it works) as the current draw is very little. At lower TX powers, it may appear OK. As you increase the power output, more current is drawn and the radio eventually shuts down on TX.

In the past I have taken the connector apart several times and re-rolled the female side of the connector, but after a half dozen times far too much damage was done and I couldn't salvage it.

New power cords are available online and in the radio mags, cost is about $15.

Eventually I solved the problem permanently.

I replaced the power connector entirely. I used two sheets of fiberglass to fill in the connector space on the body of the radio, put ring lugs on the power wires inside the radio and ran screws out through the back of the radio through the fiberglass and bolted the power cable to these with locking nuts.

Look at the audio out of the radio, preferably on the data connector with full deviation or a little more. Then vary the signal generator and set it for minimul distortion. If that isn't centered better, then it is off freq. Quieting isn't the best metric to determine frequency..

Hi to all, i am new member in this group,
The previous owner inserted a screwdriver into the vox gain trimpot breaking and causing a short on the board. Now the radio does not transmit both with activated when the vox ptt. The radio receives normal but not the tx, the red LED does not light up. Does anyone have any possible solution to this problem or may have a pattern plate B4916H to sell me. I have technical knowledge in electronics in general but not in the area of radio.Any help is welcome
Thank you all.

Greetings

From: noskosteve
Topic: 568  Message: 19369

Please Disregard this upload. The latest version of my Split/Duplex explanations was already in the Files Area.

User "aceblaggard" had uploaded an older version, so I requested that it be removed and I deleted this copy - OOPS!.

Sent from my KnightKit Crystal Set.

# 19370. Help with 706MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-10 01:04:01 UTC
From: bbunny1956
Topic: 19370  Message: 19370

Hi, I'm new to the group. I don't want to get too long winded, but here goes. I've had a 706 MKII for many years, unfortunately, it fell off a table and the Rotary encoder (SWI) SW159 is no longer functional or available from ICOM. Was hoping someone out there would happen to have a good front panel for sale? I really miss the rig and would like to fix instead of buying something new. Also, if anyone has had a similar problem and would like to share their solution/experience, it would be greatly apprciated.

I suppose you've checked the various repair shops for the part and not just icom?

Do you have any shops in mind, have not had to have anything repaired in all most 20 years.

Thanks

I highly recommend SAR Technical Services in Michigan, an independent, ICOM-approved service center.

Matt Adrian has been quite good, fast, and reasonable on repairs to my 706s.

Good ratings on E-Ham.

Larry
Talked with Matt yesterday. Looks like I might be out of luck if it
was a MKIIG there might be hope.
Matt did seem like a great person to do business with.

Thanks.
Ed

Scott Malcom at MTS is another great repair person, and he also has some back up parts available from time to time. Might want to drop him a line.

# 19380. Dualing mic jacks issue

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-13 04:17:27 UTC
From: John Geiger
Topic: 19380  Message: 19380

I have an Icom 706 original and I recently made up a cable to go between the mic jack and my computer sound card for RTTY. It is working great on RTTY-already bagged 2 new RTTY countries (PJ2 and CP). I also get the receiver audio off of the mic jack, so I dont have to tie up the speaker on the rig. I figured it would be easy to plug this cable into the rear mic jack, and leave the microphone plugged into the front jack.

That is where the unusual issue occurs. With both the RTTY cable and mic jack plugged in, RTTY still works fine, but the microphone will only put out a few watts on SSB-it wiill send a FM and AM carrier ok, though. This occurs regardless of which jack the soundcard cable is plugged into and which jack the microphone is plugged into.

Is this typical for the 706? Any idea why it might be doing this? Any ways around it other than switching cables as needed?

Both mic audio inputs are hot all time.
Try plugging cable in front so you can slide It slightly to break connection for ssb.

You should use the ACC socket on the rear. It has ptt, audio not affected by vol control, and an independent tx audio line for your RTTY

# 19383. MKIIG 70cm band not working

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-13 22:30:01 UTC
From: n1agedtc
Topic: 19383  Message: 19383

Hello folks,
I am a new member here and was happy to find such a site dedicated to this particular radio. Maybe someone can help me with this puzzling issue. I have a 1 1/2 year old mkiig and the 440 side of my radio is not working. ALL other bands and modes work perfect including 2m (obviously not finals) my needle doesn't move on FM, AM SSB etc..I have tried all power levels. It's only drawing less than one amp and it also receives fine on 440. When I key the mic, the red "TX" light illuminates etc... Any ideas?
Thanks in advance

# 19384. IC706MKii - TX Power drop on all bands after half hour.

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-13 11:06:08 UTC
From: ZL1SWW
Topic: 19384  Message: 19384

Hi all,
Ihave an IC706MKii that has been going fine for a long while. Recently it developed a fault where you get full output on TX for a while and after a bit, the output will drop off. Leaving the radio on for 3 hours, I get about 2-5 watts out. I have done the following things to check:

Power supply volts OK to rig even under load. Fuses OK and no volt drop.
It happens on all bands.
Checked dry joints on PA board.

Other things I have done to isolate the fault are:
Inject a signal into PAI (input to PA) at the desired frequency as per the dial. about -2 thru +5dBm in give me full power even after rig has been on for 3 hours. This proves the PA board is ok on all bands as checked various bands.

Putting a spectrum analyser on the PAI output feed off the main board shows a small drop in level over time. Level should be close to 0dBm or so. Mine is at cold +2dBm and then drops off to about -5 after about 3 hrs.
I am suspecting the IC1 YGR amp uPC2709T that feeds to the PA board. The HPF baord must be OK as RX is fine and the HPF handles both TX and RX paths.

Anyone had issues with the YGR amp chip? I have some on order to swap in and see.
Interestingly enough, the TX output slowly drops but in a fault state, the output can fluctate quite widely. I have tried freeze spray to no avail.

Would be interested if anyone has seen a fault like this. No amunt of cable wriggling or board tapping can exacerbate the fault.

Cheers & thanks in advance..

Simon

Hi all. im having the same problem with my 706mk2g. after a few minutes on transmitting the output drops to about 2-5 watts. i was suspecting the SWR sensing diodes. But i never had the time to check them. but it could be the amplifier IC that u mention as well.
Anybody else with the same symptoms??????

with my mk2g its similar, HF bands only, after tx for 2-6 mins the output suddenly drops to low level and remains that way regardless of waiting on rx or powering down the radio. It has been discussed here before and nobody has ever fixed one (without buying a different radio)
There is nothing wrong with the PA because, like Simon's, I traced it to a sudden loss of drive, about 20 db drop to the PA board. The recovery method is to select 2m band, click the ptt to transmit briefly, then go back to the original frequency. Works every time, for another 2-6 mins. On my radio the level does not vary, it cuts down as if there has been a shutdown called by the processor, and my reset method seems to suggest this.
Ralph

Hi Pedro,
Does your radio do it on all bands? Mine does it on both 2m & hf / 6m. There is a VFOR / FOR Signal that gets combined on the main board and then compared with the D/A off the micro for RF power. The two voltages are also compared and if one exceeds the other, it could also drop the RF back. That one is a bit hard to measure due to the OP amp being under the board..

I guess it's possible for some vicious loop re RF power control to do the same thing. I will chnage teh 2709 MMIC chip whne it turns up and see what happens. Can't hurt..

Cheers,
Simon

same symptoms here Ralph. that's why i suspected the SWR sensing Circuit from the beginning, i think this is a know problems with icom radios, the sensing diodes get bad and this triggers the signal for the microprocessor to low the power to protect the finals.

Hi Simon. Mine has the same symptoms as Ralph. VHF-UHF is ok, problem happens when on HF. it could be an operational amplifier as you mentioned. in this particular radio i change one OP before, audio was muffled on all bands, don't remember the IC number but it was that, i change it and that was it.

i suspect so far of the SWR sensing diode, IC rf preamplifier or any additional OP in the SWR sensing path.

Hi, when you say your audio was
mnuffled on all bands, was this on receive?
I have a problem with muffled audio on receive only, it's fine through headphones!

Hi Pedro,

OK I will let you know how I go. BTW, if you have the issue on HF - it maybe the relay on the PA board getting dirty / faulty. There is a litle white relay that switches the signal from the early PA driver stages thru to the appropriate final section. Maybe the swapping bands from VHF to HF and back may clean the contacts enough.

Just a thought..

Cheers,

Simon

My 706MKiiG is almost 11 years young. I have never experienced this phenomena.

I am a retired EE/Aerospace engineer [Manager] and based on what I read my first "suspicion" is a thermal problem, or a false reading thermal sensor. The processor is reducing power to reduce heat build up at a sensitive location within the radio. Cycling between VHF&UHF/HF allows time for a little cooling in the sensitive location. Check the cooling system for dust build up, make sure heat sinks are firmly seated , if bonded verify a solid bond.

We used to use a product, if I recall correctly 'freez-on', to provide diagnostic local cooling.

Hi DD,

Thanks for the input. I looked at ther thermal control. There are sensors on the PLL board and PA board. They directly come together on the PA board to drive the fan. It appears there is no signalling back to the CPU to cut down RF output.
Yes I ahve also tried freeze spray with no help.

Cheers,

Simon

> Hello folks,
> I am a new member here and was happy to find such a site dedicated to this particular radio. Maybe someone can help me with this puzzling issue. I have a 1 1/2 year old mkiig and the 440 side of my radio is not working. ALL other bands and modes work perfect including 2m (obviously not finals) my needle doesn't move on FM, AM SSB etc..I have tried all power levels. It's only drawing less than one amp and it also receives fine on 440. When I key the mic, the red "TX" light illuminates etc... Any ideas?

Kinda hard to guess. A trip to the bench with some test equipment would reveal a lot.

The PIN diode switching for 70cm band often fails.
Check this first. PC tracks can burn out around the area of the PIN switch diode too.

# 19402. IC706mk2g 2 meter problem

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-18 14:58:03 UTC
From: n3qk1
Topic: 19402  Message: 19402

I have an Icom 706 mk2g and aparently works fine on all bands except 2 meters. When I key the mike, it sometimes does not put power out at all or at other times it will hesitate for several seconds before putting power output. Then sometimes power time output is immediate. Red transmit LED comes on immediately in all instances so unit is in transmit mode. I have tried this unit on a 50 ohm dummy load rated thru 150 mhz and also a resonant antenna for 2 meters FM peaked at 146.52 witw same results. If I was going to guess on this problem, I would expect the two meter T/R relay either to have dirty or worn contacts or the contacts just are not quite making contact on every throw.

Ralph,
I was told the same thing from someone else, I need to get a better view of the schematics to see where exactly that PIN diode is located

Thanks

This happened to me a few years ago and here is what you do:

Go to this link and read the steps.
http://www.uksmg.org/content/ic706_fix.htm

All I had to do was tweak the FM VCO (C267), a step that the author in the link said wasn't necessary but it worked for me!

Let me know how it goes, OM.

# 19406. AH-2b Antenna System - Help

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-19 16:13:40 UTC
From: Larry J. Ford
Topic: 19406  Message: 19406

I'm hoping someone on the list has an ICOM AH-2b mobile antenna system (not the tuner, just the mobile antenna system) and can answer a question.

Sometime back, I bought a used AH-2b antenna system from another ham who said it was complete except for the antenna element ("whip") and the antenna element holder.

I purchased the antenna element holder from ICOM (via Matt Adrian's shop), and thought I was all set. This week I got ambitious once again about getting the system installed on my vehicle, and so decided to lay all the parts out.

I discovered the following: On the instructions, it shows the antenna element whip being inserted down into the antenna element holder (a milled cylinder with an opening at the top for the whip to slide down into and then secured by two Allen set screws). The bottom of the antenna element holder is hollow and threaded and is supposed to screw down onto the antenna base spring, which in turn is bolted to the antenna base insulator. There is a bolt which inserts through the antenna base insulator and protrudes through it and the base of the antenna base spring screws into that, and that's all there.

The problem is that with the antenna base spring the other ham sent me, there's no way for the bottom of the antenna element holder to attach to the top of the antenna base spring! Either there's a "free-standing" threaded bolt that hold the two parts together (which is missing), or there's supposed to be a bolt built into the top of the antenna base spring that is missing.

I'm trying to determine whether (1) there's an "independent," threaded bolt that connects the antenna base spring to the antenna element holder, or (2) the bolt is built into the top of the spring.

If it's (1) I need to identify the Part No. and order the bolt by itself; or, if it's (2) I need to order a new spring.

I tend to think it's No. (1) because the top of the antenna base spring the other ham sent is open and threaded with no apparent sign of any built-in bolt having broken-off.

And, yes, I have called ICOM America to identify which part, and so far the Tech Support staff and the Parts Department staff are "stumped," can't tell me which is which, and are having to "research" the question.

Thus, I thought if someone actually had one of these AH-2b antenna systems installed, he could just take a quick look and let me know which it is.

Sorry for the length of the posting.

Thanks for any help,

Larry J. Ford
KG4GPJ

Trying to visualize this- it sounds like all you need is a 3/8ths-24 coupling nut (something a standard whip and mounting stud can screw into both ends). I have seen those, and even have one or two kicking around my junk box. If you can't come up with one, let me know and I'll send you my extra. This assuming that Icom used the "standard" 3/8ths-24 thread...

Joe,

Thanks for the suggestion, but "been there, tried that," and it doesn't work. I have one of those in my "junk box," and it won't work.

Remember, these are METRIC threads, etc., and the threading on the two ICOM parts that need to join is not 3/8ths-24.

I forgot to mention that point in my original posting, but forgot (and it was long enough, as it was).

Since ICOM has not responded, I'm thinking of taking the parts down to my neighbor's machine shop and have the necessary part fabricated - if his shop can do metric sizes and threading.

Larry, do you have a fastener supply shop in town?
Or a independent hardware store or maybe Lowes
The hardware stores usually have something in metric in small bins that slide out. You may have to get a bolt and cut it. If so screw a nut on before cutting. It will clean the threads when removed.
Good luck

Mike,

No fastener supply shops here (rural area in the mountains of Western North Carolina), but there is a Lowe's over in Murphy, NC, about 16 miles away and a Home Depot in Blairsville, GA, about 12 miles away.

That's a good suggestion. Hope they carry metric sizes.

Probally won't find it at home depot but I'm pretty sure I've seen them at Lowes Give a call. A independent hardware store would be better. If you find the size, I can check here.

Every Lowes I've been to carries them.

In a message dated 1/19/2012 2:11:42 P.M. Central Standard Time,
lford@... writes:

Mike,

No fastener supply shops here (rural area in the mountains of Western
North Carolina), but there is a Lowe's over in Murphy, NC, about 16 miles away
and a Home Depot in Blairsville, GA, about 12 miles away.

That's a good suggestion. Hope they carry metric sizes.

Larry, do you have a fastener supply shop in town?
Or a independent hardware store or maybe Lowes
The hardware stores usually have something in metric in small bins that
slide out. You may have to get a bolt and cut it. If so screw a nut on before
cutting. It will clean the threads when removed.
Good luck

My first post:

Need suggestions on best way to connect 706 and Yaesu FT-2100B. I operate RTTY mostly and the ACC socket has the RTTY conection. Can I use the RTTY to connect the amp?

Thanks everyone.

Can't give you specific advice but the 706 often has a 100w spike when not at full power so hopefully that amp will tolerate 100w drive for a millisecond. I don't know if that has ever been a problem but it is with some amps and the new icom 7410 and kenwood Ts-590. I'm sure you'd rather be on the safe side. The problem usually arises in a amp that requires a low 40w drive for legal limit and then hitting it with a 100w spike. I don't know if it's a issue with the 706 series but it does spike. That's how the alc works.

Does anyone know if this has ever been a issue?

One way to do it is to purchase the Ameritron ARB-704 amp buffer/interface, with the custom ICOM 13-pin ACC port cable. That's what I did with my 706 to interface to an amp since the 706 has no amp relay port.

Of course, if you're handy enough, you can probably construct your own interface, which uses the "HSEND" pin on the ACC port (like the ARB-704 does, I believe) to key the amp (as I recollect, without looking it up again, "HSEND" is pulled to ground when the 706 is keyed). I think there's some homebrew examples out there on the web.

# 19417. Re: [ic706] 706 output "spikes" and Amp.

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-20 15:41:11 UTC
From: Larry J. Ford
Topic: 19417  Message: 19417

It is, indeed, a problem with the 706, and Phil Salas has written extensively about it.

He published an article (QST, I believe) demonstrating an "RF attenuator" he constructed to sit between the RF output of the 706 and the RF input of his solid-state Ameritron ALS-600 amp. I think he ended up with a 2 or 3 dB "buffer" so that he could run the 706 at full output power (where the ALC works better) and yet hold the input power to the ALS-600 to the 60 or 70 watts the amp could tolerate with triggering the excess input power protection circuit, which would take the amp off-line.

I have an ALS-600, also, but don't use either of my 706s with it. I use my 7200 with the ALS-600 and so far the two seem to play together well, even though the ALS-600 needs only 45 watts drive on 75 meters for 600 watts output, rising to around 70 watts drive on 20 meters.

I also use the 7200 with an Ameritron AL-1200, and it will take the full output of the 7200, spikes and all, without flinching! However, I probably would use the 706 only with the AL-1200 and not the ALS-600 unless I constructed one of Phil's devices.

From: john baker
Topic: 19384  Message: 19420

As for the speaker/headphone issue: You may jus need to wiggle the connector for the speaker. It may just have some corrosion on it.

For the power drop: By a similar token, It sounds like it happens just as the rig has gotten good and warmed up. The first thing I would try is to pop the hood and make sure everything inside is tight, especially screws for the circuit boards. It could just be that there is good contact while it is cold but as things expand when warmed up it is just enough to cause a bad contact.

Every issue I have ever had with this little rig has been a contact issue, being mobil usually external in my case.

God bless

My 706MK2 has been working great, yesterday after switching from 40 to 20 meters I noticed the audio sounded tinny or like it was switching from stero to mono. on 40 and 80 meters it still sounds good but every other band is tinny sounding. It doesn't seem to matter if it is the radio speaker or a external speaker. Anyone have any idea of what is going on?

As you normally use lsb on 40 and below and usb above, find an AM station, WWV may be a good one to start with, and listen to it on ssb.  Switch between lsb and usb and see if it is tinny on usb.  If so, the usb frequency needs to be adjusted.

# 19427. ICOM-706 memory spontaniously clearing?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-25 14:27:44 UTC
From: cutterjeff
Topic: 19427  Message: 19427

I picked up an old ICOM-706 (original, not MKII, not G) recently for use in my truck.

Works great, and I'm really enjoying the thing, except for one issue.

Twice now, I've turned the key and all memories in the radio were blank.

The first time, I'd left the truck parked for less than 15 minutes. Park, get out, unload, get back in, turn the key, and all the memories are blank.

Second time was last night. Parked at 6:30 PM, started the truck at 6:05 AM, and ... blank.

I thought to myself, "Ah! older radio, need to change the memory battery.... " but the manual says it's all EEPROM, so that can't be it.

Has anyone had this kind of problem?
Is there any fix for it?

73,
AI4YC

# 19428. RE: [ic706] ICOM-706 memory spontaneously clearing?

Yahoo group: ic706 (2010 — 2015)

Topic: 19427  Message: 19428

Voltage spikes when starting can do strange things if the radio is connected directly to the battery. Just as an experiment I'd try being sure that the radio is momentarily disconnected from the battery while cranking the engine. A relay with 20-25 amp contacts keyed from the "on" position of the ignition key should do the trick. Be sure the relay drops out when the engine is cranking or when it is off.

Just an experiment to see if it helps. Easily removed if not needed. However, you may want to keep it because 706's have been known to drain a car battery after a few days because of their higher than average current draw even when turned off.

From: Larry J. Ford
Topic: 19429  Message: 19429

Wasn't there a "homebrew" project in QST in recent years which employed a relay and/or IC timer to (1) delay the application of power from the battery to the rig for a few seconds while the vehicle was being started and (2) delay the shutoff of power to the rig until something 1ike 10 seconds after the ignition switch was turned-off? Seems like avoiding the power spikes described below was the goal.

I also think there is a commercial product which does the same but is a bit pricey. Homebrewing a device like this would seem like a fun and useful project - not that I'm capable of designing or prototyping it!

Wait, if this radio has been in this vehicle for a while then you might
want to have the battery tested.

I've had it about a month - my wife got it for me for Christmas.
She bought it off another ham.
I'm fortunate that my wife got into Ham radio when I did, and enjoys
it as much as I do.

Getting the battery tested couldn't hurt , though.
I do have one confusion: even if the battery zeroed, shouldn't the
EEPROM hold memory setting?

I'm in Florida.

I think it was on during starting.
I guess I need to get in the habit of shutting it off.

# 19436. Re: [ic706] ICOM-706 memory spontaneously clearing - Power Spikes?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-25 16:03:16 UTC
From: Jeffrey Schwartz
Topic: 19429  Message: 19436

I played with the idea of putting a small 12V rechargeable battery on
some kind of isolator, then powering the radio from that.

Has anyone tried that?

On Wed, Jan 25, 2012 at 11:01, Larry J. Ford <lford@...> wrote:

From: Larry J. Ford
Topic: 19429  Message: 19437

It shouldn't be too small or the 706 will drain it very quickly.

Seems like it would have to be recharging constantly from the vehicle power, but perhaps that's what you've got in mind.

Then it's an especially small battery or a broken 706. Current draw should be less than 5mA when off.

I'm sure a number of people have tried it, but it's an expensive and complicated way to power a radio that should just work directly from the vehicle. There are untold thousands of 706's in untold numbers of different vehicles all over the world that do not require an intermediate power source to operate. Therefore the problem is in your radio, or your vehicle.

First thing I'd check is the integrity of the radio power wiring, the vehicle battery and alternator wiring, engine and chassis grounds, and the radio installation overall. The typical load dump profile of a starting cycle should not bother the radio, but if there's a bad ground or improper power connection you could be subjecting the radio to spikes or chassis current way beyond what it would be expected to tolerate. A relay that cuts off the power during cranking may solve the symptom but you still may have a grounding or power issue.

I'll buy that logic.

Actually, I'd _rather_ it be an issue with the vehicle grounding than
a bad EEPROM.
I can fix grounding...

"There are untold thousands of 706's in untold numbers of different vehicles all over the world that do not require an intermediate power source to operate."

Wait until they all kill their primary battery.... I'll be setting up my new truck with two Optima batteries for starting and another dedicated one for the radio equipment. I've killed far too many batteries in far too many vehicles in nearly two decades leaving a power hungry 706 turned on.

Kurt

I keep hearing about these "spikes"when starting... I've had a 706, a 706MKIIG, and now a 7000 in several different vehicles over at least 13 years now, and never once had an issue with this. My Original 706 works as well as the day I bought it, and my 7000 has been mobile from day one, bought right after they were introduced. I would love to hear from someone that actually had a failure PROVEN to be from running the rig off the standard vehicle power system, presumably as they were designed to be run.

Just curious -- I believe going through all that trouble is a waste of time & energy. To have it on a separate system so you don't kill you starting battery is a whole different thing, and I fully understand that logic.

# 19445. 706MK2G intermittent bad audio

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-26 01:10:37 UTC
From: Jimmy
Topic: 19445  Message: 19445

I have just recently developed this problem. All of a sudden, my 706 has bad audio on both Xmit & Recv. On receiver, it sounds like a nearby strong station is desensing my receiver. It only happens fpr a short period of time then reverts back to normal. It does not seem to heat related as it happens if the rig is just turned on or after its been on a while. An muffin fan placed on the unit does not help.

From: gw0div@btinternet.com
Topic: 19429  Message: 19446

The memories live in the control head, at least the seem to on the MK2g - might it just be a control head connection problem?

Maybe remove control head and make sure the contacts are clean?

From: Tom Root
Topic: 19429  Message: 19448

When I park my vehicle, either temporarily or overnight, and turn off the engine, I always take a moment to turn off all the electricals in my vehicle..the AM/FM radio, the A/C, the windshield wipers, the lights, and any amateur radio or SWL gear that I'm running from the vehicle's electrical system..this practice has served me well.

Here's a link to a setup used in a Prius. They used a Gel-Cell and a Hellroaring isolator. <http://wa8lmf.net/mobile/prius/index.htm> In his case, part of the concern was how tiny a Prius' 12V battery is, combined with wanting to operate with the car turned off at times. But the set-up would work in any vehicle. See the links within the article for crude schematics.

"The memories live in the control head, at least the seem to on the MK2g - might it just be a control head connection problem?"

Interesting. How about static? I can't count the number of times I've drawn an arc from my finger, around the buttons into the radio head when reaching for the power or other buttons.

From: Don
Topic: 19451  Message: 19451

Hi Folks

i got a Mk2 that's dead. Troubleshot it to the L8 signal on the PA board. I got the L8 signal at the connector but as it goes through that daisy chain of transistors to the R131 pot, it gets lost. So most likely one of those 3 Q puppies are dead. The 8V line is good too.

So whats the problem ??? The problem is I can't see the parts layout on the PA board in the service manual. Real bad color contrast. Is the real documentation from ICOM better than the stuff on the internet??? is it clear where those Q's are located or do i just slug it out with my meter and map em myself. Not sure if anyone has mapped these before...

Would love to know where to look before I fire up the 200 watt soldering iron and attack those chippy things.

thanks all

# 19452. 6 pin data port with a Rigblaster P&P

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-27 12:31:14 UTC
From: n1agedtc
Topic: 19452  Message: 19452

Hello,
Im wondering if anyone has tried using the 6pin din connector with a rigblaster plug and play? Here is my situation, I am running a amplifier which obviously utilizes the 13 pin din connector. logically speaking the 6 pin should work for digital operation? From what I'm getting here is that the 6pin is not giving any voltage to key the mic? I can receive, however when I send, the radio doesn't go into TX mode. Any ideas besides having to purchase a siglink? I can't be the only person in the world that uses an amplifier with a rigblaster P&P!
Thanks in advance 73
Dana Copley
N1AGE

PS- when speaking to the techs at West Mountain, they have told me that people HAVE used the 6pin with the plug and play. Could it be a setting in the menu?

# 19453. Re: [ic706] 6 pin data port with a Rigblaster P&P

Topic: 19452  Message: 19453

Not sure about how the Rigblaster works, but pin 3 on the 6 pin connector needs to be grounded to transmit. Also, If I remember correctly, the data speed (set menu #29) needs to be at 1200 for audio. If this isn't right, please correct. I'm working from memory because my K3 has direct audio input and output for the digi modes.

73,

Carl

AB1DD

Resistance is futile.

(don't know about reactance, though)

Is the "break-in" still on? Try keying the Mic in CW mode and then using the key. Can you hear a side tone?

From: Bill
Topic: 19458  Message: 19458

Hi All,
i just wondered if anyone has used the IC706 to listen/decode
weather sats on 137mhz, wbfm.
I have listened but not heard any at all even though they were supposed
to be overhead at the time.
I take it the antenna on 137mhz would be i the vhf socket and not hf!
dumb question i know!
Bill

I just tuned to that frequency, and I'm hearing what sounds like widely spaced "data bursts." Don't have any way to decode those bursts, unless an old Kantronics ALL-Mode TNC or an MFJ-1278 TNC will do the trick.

I'll have to tune up there and give a listen. My MFJ 1275 will decode that stuff if I read the literature right. And yes you'd need to use the vhf antenna port. It's not a dumb question---the only dumb questions are the ones we fail to ask.

Hi Wayne, Larry,
thanks both for the reply. I have the sat
frequencies in the memories now so will try again over the coming week.
I used to listen/decode them years ago with a kit built receiver
specially for the job and i also had a home made quadrafiler (thinks
thats how it's spelt!) antenna. I think i still have that up in my loft
space. Larry you can decode the signals just by plugging the audio into
your soundcard and use some free software like WxtoImg or Wxsat or
satsignal. I have WxtoImg which also gives upto date pass times.
Thanks
Bill

Bill,

I was using an old ICOM IC-706 MKII to receive those signals on 137.000 MHz. I think I'd have to have either a Signalink interface, or one of those soundcard interfaces (kit or commercial, with audio isolation transformers) like are used with PSK-31 to interface the 706 to my laptop soundcard.

I don't think it would be as simple as running a wire or cable with appropriate connectors on each end from the external speaker output of the 706 to the soundcard mic input, would it?

Thanks,

Larry J. Ford

# 19463. Re: [ic706] weather sats

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-30 17:10:50 UTC
From: Jeffrey Schwartz
Topic: 19458  Message: 19463

I talked to a Ham once who ran such a cable from his HF rig to his computer, and it worked.

He made the comment that he really should have put isolation on it, but the computer in question was so old that someone had given it to him for free at a ham fest, so if it got broken, he wasn't going to get upset. (Unsure if he'd thought about the radio getting toasted, though.... )

Talked to another ham who used duct tape... seriously. He wanted to fiddle with PSK, but didn't want to spend money until he knew if he liked it or not. So he took a cheap microphone, plugged it into the computer, and duct taped it to the speaker on his radio. Then put his computer speaker right up against the microphone, and set VOX on the radio. When sending, he prefixed all his sends with his call sign - that gave the VOX time to click and start transmitting.

I've used PocketDigi on my old PDA to do CW decoding, just by laying the PDA on top of the rig. That works OK as long as there isn't too much background noise.

I sometimes play with the idea of getting a little speaker, and duct taping it to one end of a toilet paper tube, and a microphone in the other, and then wrapping the whole things with foam or bubble wrap. I see old microphones at Goodwill for a buck, and speakers now and then, so it'd be a less than $2 experiment. If it works, fine, if not, then toss it.

yes, it is that simple! :)

You can just take radio out <-> soundcard in; and radio in <-> soundcard out.
I've done this from the ACC, but you could probably do it from any of the ports if needed ... It's also possible (in a pinch) to just put PC mic by radio speaker, and hold radio mic to PC speaker (it's been known to work for psk).

I did have a problem of a severe hum on SSB with the direct audio cabling like that -- a interface kit (ISOKit from buxcomm) fixed that (the key being isolation transformers)

That (and a PTT line or VOX) gets you set for any of the soundcard modes (PSK31, AFSK RTTY, JT65, etc, etc)

# 19465. Re: [ic706] 706 to PC connection for weather sats decoding

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-30 20:21:09 UTC
From: Larry J. Ford
Topic: 19465  Message: 19465

I know what kind of connector is needed for the Ext. Speaker port on the 706, and I've got one of those plugs in my "parts box," but what's the exact description of the plug needed to fit into the mic jack on the laptop?

Is that a 2.5 mm plug with left, right, and ground rings?

I guess I could cannibalize an old PC mic cord that has the mic jack already on it, and just solder the speaker plug on the other end.

Thanks.

This might help

http://www.brazoriacountyares.org/winlink-collection/AGW/PE%20Pro/pehelp/6scinterface.htm

I know you're building it without the isolation,but the pinouts for
the plugs are there

# 19467. Re: [ic706] 706 to PC connection for weather sats decoding

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-30 20:41:08 UTC
From: Larry J. Ford
Topic: 19465  Message: 19467

Wow! Looks like that page answers my questions, plus much, much more!

It also recommends NOT to go direct from the rig to the PC for RX audio, but use isolation instead.

Thanks,

Larry J. Ford
KG4GPJ

This might help

http://www.brazoriacountyares.org/winlink-collection/AGW/PE%20Pro/pehelp/6scinterface.htm

I know you're building it without the isolation,but the pinouts for
the plugs are there

On Mon, Jan 30, 2012 at 15:21, Larry J. Ford <lford@...> wrote:

# 19468. Re: [ic706] 706 to PC connection for weather sats decoding

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-30 20:49:06 UTC
From: Jeffrey Schwartz
Topic: 19465  Message: 19468

Yeah, that's the best practice.
The Ham who told me he did it straight said he just wanted to fiddle
with PSK for an hour or two, and if he liked it, he'd build a real
interface.

So , I guess, how much fiddling are you going to do with Wx?

Is it "just once" to say you did it, or are you going any kind of
digital on any kind of regular basis?

If the latter, then building isolated would be much more better.

From: Gregory
Topic: 19454  Message: 19469

It's in the semi break in setting. I keyed the mic in the cw mode and used the key but no side tone.

To hear the side tone, make sure the volume is up. Thebeep/sidetone pot is on the side of the radio

73,

Carl

AB1DD

Resistance is futile.

(don't know about reactance, though)

# 19471. Original 706 and mk 2 (not G) compatibility

Yahoo group: ic706 (2010 — 2015)
Date: 2012-01-31 00:53:40 UTC
From: ka9p@aol.com
Topic: 19471  Message: 19471

Hi.

This ground may have been plowed but is it known whether the 706 original flavor and 706 mk 2 are compatable as far as basic functions go - ie can I switch the control heads?

My original's display is starting to delaminate and I got a great deal on a MK 2 in hopes of using the head (or just using the MK2 in case of the inevitable) but thought maybe, just maybe.....

Also, are there any affordable aftermarket cw filters available for the MK2 these days?

Thanks alot.

Scott

There are no aftermarket CW filters for the 706. INRAD makes a SSB filter,
but not CW ones. I have a 500hz I would sell if you are interested.

"It also recommends NOT to go direct from the rig to the PC for RX audio,
but use isolation instead."

A good idea. Due to bad wiring in the shack, I had 120 VAC on my audio line
for years.

Kurt

From: noskosteve
Topic: 19429  Message: 19476

I'm quite sure the memories are not in the control head. The CI-V routes to the internal micro and the radio can be operated without the control head by spoofing the control head signals. A couple of hams have done this.

From: gw0div@btinternet.com
Topic: 19429  Message: 19477

I have one 706MK2g and 2 control heads, the memories are different depending which head I fit. Had some 2m repeaters in head 1 fitted head 2 and all the memories were gone, programmed the 2m repeaters and some 70cm repeaters into head 2, then went back to head 1 to find the 2m repeaters and no 70cm??

Unless the memories were in the head I'm not sure what happened here??

Confused

# 19478. Re: ICOM-706 memory spontaneously clearing - Possible fix (at least in my case)

Yahoo group: ic706 (2010 — 2015)
Date: 2012-02-03 13:16:26 UTC
From: Jeffrey Schwartz
Topic: 19478  Message: 19478

Last weekend, the problem happened again - got in the truck, turned the key, no memories.
After the following stop, though, the radio wouldn't even turn on... Nada.

While the display remained blank, when I tried listening very carefully, I could hear the faintest 'click' of a relay when I tapped the power switch.

I went back to the service manual, and thought some more.

"Ah!"

Power goes to the PA direct , but there's the "circuit fuse" that protects the processor and other electronics. "Obviously, " said I, "the circuit fuse blew."

I opened up the radio... and the fuse looked good - no blackened glass, I could see the filament inside.

"I'll pull it and check it with my ohmmeter"

It was _very_ loose in the clip that held it - just touching it caused it to fall out. Of course, it fell out _into_ the radio, so it took some fiddling around to get it out. The meter check showed a good fuse, but there was some discoloration on the clip and the ends of the fuse, which I cleaned off.

I put the fuse back in - and wiggled one of the fuse clips for a better connection. There was a "click" , and it seated fully.

My theory at the moment is that the circuit fuse was loose in the clip, and that caused some arcing, which lead to increased resistance as the metals corroded. There's an increase in current draw when writing to an EEPROM... so I think what happened is that the radio didn't get a clean write _sometimes_. When that happened, it worked fine until I shut it off. During reboot, however, it would get a bad read (corrupt data during the write cycle), and decide there was a problem, and then do a full factory reset to continue.

Ok, what did you do to fix it? Tighten the clip? Resolder it? Was the clip loose holding the fuse or the clip loose on the circuit board?

From: w8joe@rocketmail.com
Topic: 19480  Message: 19480

Hello everyone. I've had my 706 almost from the start, as it's serial number is 6xxx. But, until recently never used it much. I originally got it for a trip to Costa Rico (where it worked great, by the way).

Now, having set up a second ham station in my bedroom, I am using it a lot. I am trying to work dx and use split. The whole process seems rather clumsy. Any hints?

Joe N8TI

Set up VFO A & B, turn on split, then flip between the VFOs when required. Working split is a bit clumsy no matter what. Of course, a "big" rig with dual receive makes it somewhat less clumsy. LOL

Hello to the group. I am new to this group and would like to say thanks for all the great reading from you guys. I am having RigCAT control problems with my Icom MKII G in fldigi for Ubuntu Linux. Keep getting "get_frequency" errors on both tty0 and tty1 serial port settings. I am using the CAT cable from Icom. Can transmit and receive great with Signal Link, but cannot control frequency from the desktop. I used the settings i found in rig control wiki for fldigi. Any help would be appreciated.

To use the serial port, I think so. I haven't had to deal with that, but, I'm using a 5 dollar hong kong special USB cable Prolific chipset, and I didn't have to se anything. It recognized it right away, set it, and now its working great. I'm liking Ububtu more and more each day.

I am new to this group and have had the same problem, It seems that using USB comverter to connect can cause conflicts. My solution wa to fit an RS 232 card and connect through this to the ic 706, result no problem.

# 19488. Tone Squelch Module

Yahoo group: ic706 (2010 — 2015)
Date: 2012-02-07 04:25:04 UTC
From: adam_laurich
Topic: 19488  Message: 19488

I recently purchased an IC-706MKII at a ham fest and have been happy so far until I tried to contact a local repeater that uses a squelch tone. The UT-86 module seems to be difficult to find, would the UT-88 module work? In some other Icom radios such as the IC-V68, the manual shows the modules to be interchangeable (with the exception that the UT-88 has some scrambling functions). The modules appear to be physicality similar. Would the 706 accept the UT-88 and use it's squelch functions, or am I going to have to wait patently until someone offers a UT-86 for sale?

Thanks,
Adam
KK4FSY

Hi Adam,
As far as I have noticed, unless mine has the module in it, T-SQL is built in. I got mine from my ARES EC and he didnt tell me much about it.

I love my 706!

Maybe I should make a bumper sticker? :-)

Tone squelch standard

Tone squelch operation is available in FM mode for basic signalling
and quiet standby. Tone frequencies can be set independently for tone
squelch (Tx/Rx) and repeater tones, and a range of 50 frequencies is
available. A tone scan function is available to search for a
repeater's access tone quickly and easily.

Hi Adam, welcome to Ham Radio and the 706. You may be confused or I may be. I don't think you need that tone squelch unit. That would be if you want your receive tone squelch.

Go into the menu to item q4 rptr tone and select tone. This will put a tone on your transmit to open the repeater.

If you need more detail help email me or call 817 774 8758.

Sorry I couldn't reply sooner.

You are right! The squelch unit is only used to squelch receiving tones. I brought out the HT and and tested my 706, it is transmitting the tones just fine. I guess I have to fallow the K.I.S.S. method instead of rummaging around in schematics and service manuals.

Thanks for the responses,
Adam

# 19494. IC-706MKII cooling fan does not turn on any more

Yahoo group: ic706 (2010 — 2015)
Date: 2012-02-09 11:53:32 UTC
From: Antoine
Topic: 19494  Message: 19494

Hi,

This is 3D2AG Tony; during recent DXpedition to Rotuma Island I had a problem with my ICOM 706MKII, in that the cooling fan did not turn on any more during TX or RX. To avoid the high temperature on rig and continue the pileups, I had to unplug the fan connector from the board, and connect the wires directly to the 12V power supply via a variable resistor! Could this be a problem with thermal sensor? Where is the sensor, and how to check / replace? Any suggestions welcome. VY 73 es DX!

# 19495. re:[ic706] IC-706MKII cooling fan does not turn on any more

Yahoo group: ic706 (2010 — 2015)

From: dunsul@attglobal.net
Topic: 19494  Message: 19495

Hey Tony, What ever your problem is I have already found a modification online that keeps the fan running all of the time at a low speed and then turns on at normal speed when it normally should. Radio runs to hot out of the box for me... I don't know why they shut this fan off unless they are trying to boost the low current receive numbers when the fan is not running? My sarcasm may not be far from the truth. Tony N2VAJ ---- Original Message ---- From: "Antoine" To: ic706@yahoogroups.com Cc: Subject: [ic706] IC-706MKII cooling fan does not turn on any more Date: Thu, February 09, 2012, 11:53:00 ?

Hi,

This is 3D2AG Tony; during recent DXpedition to Rotuma Island I had a problem with my ICOM 706MKII, in that the cooling fan did not turn on any more during TX or RX. To avoid the high temperature on rig and continue the pileups, I had to unplug the fan connector from the board, and connect the wires directly to the 12V power supply via a variable resistor! Could this be a problem with thermal sensor? Where is the sensor, and how to check / replace? Any suggestions welcome. VY 73 es DX!

Hi Tony, Thanks for the tip; yes I've heard about that mod. My problem is that the fan never turns on when it should so I would need to manually adjust the speed unless I find the cause of the problem (faulty thermistor?) The initial problem was a corroded power lead into the fan, but when I soldered it back on the fan never turned on automatically afterwards (heat damage to thermistor during the first incident?)The fan motor is still good. Hi Tony, I realize my comments did not help you with your basic problem however if you want to trouble shoot the thermistor then look up its resistance value and substitute a resistor in place of the sensor, if it is not a silicon based intergrated diode reference and substitute the resistor in its place at a value that would equal a higher temperature where the fan should turn on. Plenty of service manuals out there for you to identify the circuit. Good Luck! Hi again Tony, Thanks for this advice. I will try and look up the circuits on internet. My rig is the IC-706MKII Japanese domestic model version (bought in Akihabara in 1999). Even during normal operation, especially in tropical countries, the rig gets very hot even on receive only. On this last episode, the fan gave up all of a sudden during a big pileup with Europe and I did not notice the event until I touched the top of the radio by accident! You could have cooked an egg on it, Hi :-) I'm lucky that the finals did not give up then... Best 73, Tony 3D2AG --- In ic706@yahoogroups.com, dunsul@... wrote: > > Hi Tony, > > I realize my comments did not help you with your basic problem however if > you want to trouble shoot the thermistor then look up its resistance value > and substitute a resistor in place of the sensor, if it is not a silicon based > intergrated diode reference and substitute the resistor in its place at a > value that would equal a higher temperature where the fan should turn on. > > Plenty of service manuals out there for you to identify the circuit. > > Good Luck! > > Tony > > N2VAJ > > > > ---- Original Message ---- > > From: "Antoine" > To: ic706@yahoogroups.com > Cc: > Subject: Re: re:[ic706] IC-706MKII cooling fan does not turn on any more > Date: Fri, February 10, 2012, 02:37:00 > > > > > 4.01//EN" "http://www.w3.org/TR/html4/strict.dtd"> > > > > >

It will Gary.. There is no CAT command to put the 706 into transmit. PTT needs to be done with an outside keying method. After setting up PTT in DM780 of HRD you need to use the TX macro to do it but the TX button in the radio control will not work for any of the 706 radios..

Date: 2012-02-21 18:45:06 UTC
From: Larry
Topic: 19503  Message: 19503

Picked up a separation cable for my 706. When I hit the power button I get a relay click on and off. Is the screw required to complete a ground for the cable to make the radio turn on? Am I missing something else? I got the cable off Ebay...I have the feeling I got hosed.

Thanks and 73,

Larry, N2HBX

Check the circuit fuse inside the radio - same symptom for me when it
was loose.

Also, check to see if one or more contacts isn't fully seated on the cable.

I wouldn't try it without it, all the connections could be loose/erratic. Check Ace Hardware for the tiny little metric screw, someone here can tell you the size.

Kurt

You need the screw to prevent many kinds of problems. It is metric and commonly available at Lowe's or Home Depot if you can't find one in a junk box.

I am new to this group and new to Ham radio.
I am using a 706 MKIIG for email transmittal on Airmail and WL2K as well as weather faxes on my boat.
I use a Pactor IIex licensed for PactorIII and a Windows PC with XP5.1
I was told that I could remotely control the radio from my computer using a OPC-478UC cable which I bought.
I am struggling with the address, baud and other settings to make it work.
Can someone help me with this?
I would really appreciate.
Thanks,

Jean Marc

It is in fact ground point for the screen. See the metal insert in the hole?

RF feedback can occur without it.

It is 3 mm diam and 6mm long. Get some from a discarded PC power supply from
a repair shop.

in the hole?

If not, you may need to cut away some plastic to find the ground & solder a
loop to the screen connection. It may have been broken off in its previous
life.
Like the man said, its the first place to look when weird stuff starts
haappening. Then go thru the contact cleaning routine.

# 19517. Band up and down buttons don't work and unit always powers up in factory reset

Yahoo group: ic706 (2010 — 2015)
Date: 2012-02-22 13:26:48 UTC
From: ve3bv
Topic: 19517  Message: 19517

Ive posted this before and thought I would give it another go.
I have a 706mk2 which was hit by lightning years ago. Ive replaced various parts and boards and unit is back on air..the issue now is when you power up the unit it does a Factory Reset every time. You can get the Band up down buttons to do various functions in the setup using the Display Hold function. I had the working properly and shortly after the memory seems to be stuck in reset. I have done the reset (hold down /up/down power 100 times still no change. Does anyone know where I could start checking voltages or clk pulses?? I almost have an idea that the line is open or shorted.If you have ever worked on these rigs to replace some parts there is ribbon connectors gallor to undu. maybe a place to look but Im stumped.. any help appreciated ..bruce

From: Larry
Topic: 19503  Message: 19519

Hey Guys!

Appreciate all the input...problem has been fixed.

Went inside, tightened the fuseholder clips and tightened all the circuit board mounting screws. Then, I took some contact cleaner and cleaned all of the mating connectors on the radio and the cable. Put it all back together. After a few false starts (sort of like getting a car to start that's been sitting awhile), the radio came on and stayed on. Tested it off and on all day yesterday, leaving it on to make sure it stayed powered up, turned it off for a while to make sure it would power up again. Installed the screw just for luck. Looks like we have a winner!

On the subject of Ebay, I think in almost 10 years, I've only gotten really screwed once out of a couple hundred transactions. Not too bad an average. Maybe I've just been really lucky.

Thanks again for everyone's help!

73,
Larry, N2HBX

# 19520. Tune button stopped working

Yahoo group: ic706 (2010 — 2015)
Date: 2012-02-25 13:56:46 UTC
From: w8joe@rocketmail.com
Topic: 19520  Message: 19520

Hello everyone. Yesterday, when I turned on my IC706 (original model serial number 6xxx), the tune button was dead. I have a LDG tuner hooked up to it via the control connector cable and the tuner was not reading the radio. In fact, the tuner had frozen up and only started working after I unplugged it's power supply and unplugged its control cable from the radio.

The red light dies not come on on the tune button.

The tune button feels like it is not mechanically working. It feels like someone glued it in place. The button was getting hard to work.

Has anyone hasd this problem? I keep the radio in a closet, locked away from my cats (aka "Seal Team Six" as they destroy everything they gets their paws on), so I know nobody messed with the radio mechanically.

The tuner had power going to it, but not the radio when I shut it down as I unplugged the power supply.

How can I free the button mechanically? Spray something on it? Admittedly, it was getting hard to push. The preamp button is the same way. Been like that for years. I never used the radio much at all since I got it. Within the last ten years probably only five or six times until a month ago when I set it up in my new closet operating station. Now I use it every day.

The tuner works again, plugged in to the rig via the control cable, but it is like the control cable is not hooked up. You can't use the tune button, of course. I really liked that.

Any advice would be appreciated The only other problem with rig is low output (75 watts) on 40 meters regardless of antenna used. I coukc live with that. I only run CW.

Thanks.

Joe N8TI

If you press the tune button does it give you a beep ?? if so it's not a mechanical issue..If it don't and it feels stiff take the head apart and clean up the cat stuff.. hair , dander , pee, etc.

From: n0sya
Topic: 19522  Message: 19525

Great you got the 706/tuner going again. The buttons on my 706 stick as well but so far have always been manhandled into submission. About once a month removing the face and reinstalling it, along with a shot of contact cleaner on the pins and contact surfaces, may help keep the 706 happy. The 40m low power issue may be a relay being spotty. The original 706 is infamous for bad relays after some period of years. If you intend on keeping the 706 you might consider replacing those relays. The prob is bad relays may just relay rf into places Icom never intended, such as 40m rf into the 20m bandpass and so on. Some thoughts for you,

Chris

# 19526. 706mkIIg parts unit available

Yahoo group: ic706 (2010 — 2015)
Date: 2012-02-26 08:34:19 UTC
From: on1cfx
Topic: 19526  Message: 19526

Hi,

my 706mkIIg developed the fault over the winter where tracks get eaten on the PLL board. When opening up, things were pretty messy, with gunk everywhere. This has shorted 13V on the 5V of the PLL board, after repair, 60MHz LO is fine, but the first LO is inop. Anyway, this is pretty much unrepairable imo, since this 5V goes on the main board too...
Everything in terms of control seems to function: the head displays fine, so I guess CPU running, relays clicking when changing bands etc, but off course, without LO, no RX/TX, and the only noise is on FM.
I am not going to invest in the PLL board to find some other problem on the main board so, if anybody needs parts make me a sensible
offer, so I can recoup a bit for a new radio.

RIP 706mkIIg, you did well.

73 de xtof on4iy

PS: I am in Europe with the radio but can send from US in a month.

# 19527. Repair

GD All,

I have a first version 706 and tried to fix it several times then I just let it sit and it has sat now I would like to repair it but the only repair equipment that I have is a DVM and SWR/Power meter. I know that this is not enuff to fix this radio.

I was wondering if anyone is willing to repair this rig for me for a nominal price or the price of shipping both ways?

Thank you all,

Harold/KD8DVY

If you can't get some kind person to fix it for less than the usual commercial rates, I'd recommend Icom Service Center Michigan (Matt Adrian), located in St. Joseph MI, who took care of my MKIIG a few years back. I am very satisfied. See my more comprehensive review on eham.net.

Icom Service Center - Michigan
(269) 429-2334
1792 Nash Drive
St. Joseph, Mi 49085

His Web site is http://www.sarts1.com

The rig has low power out and the swr circuit/meter is not working. There is also a broken trace and wire right behind the control head in the main unit. I am not able to use the rig blaster no mic to TX psk/rtty or my other digital modes.

I got the rig second hand and liked it. However it has given me nothing but trouble.

Harold

I'm having power issues too. For example:

1. 144 Mhz FM max output = 5 watts (should be 10 watts).
2. 144 Mhz AM max output = 3.5 watts (should be 4 watts). This may be the K-PO SX-600 SWR inaccuracy.
3. 50 Mhz FM max output = 30 watts on half power (5 of 10).
4. Any more than half power (5 of 10) on 50 Mhz the internal fan slows down and the power starts going back down, until it start breaking up and completely drops out, resetting the radio.
5. 50 Mhz AM half (5 of 10) output = 8 watts and 20 watts max on full power.
6. 24.89 Mhz FM max output = 40 watts (should be 100 watts).
7. 24.89 Mhz AM max output = 10 watts (should be 40 watts).
8. 7.00 Mhz FM max output = 35 watts (should be 100 watts).
9. 7.00 Mhz AM max output = 20 watts (should be 40 watts).

I'm going to start making enquires to see if this is possibly a Q1 and D18 issue, of partially.

# 19540. Connecting IC706 to Microphone input of PC

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-08 15:07:55 UTC
From: Hooman
Topic: 19540  Message: 19540

Hi there!

I am student and Have a project that I have to connect IC706 MKIIG to Computer for decoding some satellite dowlink audio and show telemetry data. However, I am not sure how I can safely connect the Radio to Microphone socket with "jack to jack cable". It would be appreciate if you help me to understand how I have to connect without breaking sound card.

Thank you in advance

Sincerely

Hooman

If you're attempting to connect the 706 to a computer soundcard, you need one of those "soundcard interfaces" that are used to interface with a 706 for use with PSK-31 or other amateur radio soundcard mode programs.

The Signalink device is a very popular, wide-used commercially-available device for such purpose, and you can buy (or make) a cable to connect the Signalink to the 706. Then the soundcard plugs into the Signalink.

http://www.tigertronics.com

Or, if desiring a cheaper, "DIY" approach, you could build one of the many kits available for such purposes.

http://sites.google.com/site/kh6tyinterface

Either approach will isolate the soundcard input from the rig output so as to avoid, as you put it, "breaking sound card." (Actually, I might be more worried about breaking the rig!)

Hooman,
If you're just monitoring, you can run the speaker out from the radio to the mic or aux in on the pc. Auxillary would be better, but if you dont plan on transmitting, that is a quick way.

However, if you are going to transmit, then yeah, Larry is correct.

Dave,

Thanks for posting that "clarification." After I posted my response, I did wonder if he meant "receive only" for audio, like the PSK-31 tones, and meant to re-post but got too busy.

But he did mention something about "telemetry data" as well, so if it's reception of data signals in a mode other than audio tones, then some interface is likely still required?

Hello everybody,

Thank you so much for your help.

I just want to monitoring the telemetry and I don't want to transmit anything.

So as Dave wrote, I will connect the speaker output of the IC-706 radio to my PC line-in input. and I Will tell you the result.

If I am wrong, please tell me(before doing the experience )

yours most sincerely
Hooman Jazebizadeh

Dear Friends,

I am sorry if I use some words that is not clear. since I am new in this field. I do my best this time:
I just wanna connect "HEADPHONE JACK [PHONES]" or "EXTERNAL SPEAKER JACK [EXT SP]" of the RADIO to Microphonne or "line-in" input of sound card. and use some software like this:
http://www.delfic3.nl/index.php?option=com_content&task=view&id=94&Itemid=123

Many Thanks

sincerely
Hooman

"However, I am not sure how I can safely connect the Radio to Microphone socket with "jack to jack cable". It would be appreciate if you help me to understand how I have to connect without breaking sound card."

I have connected my 706 to many computers since the mid-90's with a simple 1/8" audio cable without problems other than a ground-loop using one model of laptop, this was remedied by flipping the power cord over.

After you have everything connected, turn up the volume until you get the desired results, on my radio, about 1/4 the range of volume.

For transmit, I connect the soundcard output to the 706 microphone connection and use VOX. and increase the volume output of my computer until I get the desured results. I also do this with my Kenwood 570D. No special interface, no problems ever.

Kurt

I have done the same thing with my Icom 706 original. Used a RJ45 cable I had laying around, as well as a patch cable with 1/8" jacks on each end. Spliced the two cables together and was on RTTY-no extra cost to me. It has worked fine so far, giving me a few new RTTY countries since I did this at the beginning of January.

No, Hooman, u are fine, I know what you mean, and yes, you can run just a cable from either headphones or speaker from the radio to the aux or mic in on the computer. You will need to adjust your soundcard settings to make sure the software is getting the information to decode it.

You can also do that ot decode CW, Morse Code or even weather satellites, as well as many other digital modes. Its a good way to play around and see what each one is, but keep in mind there are a TON of modes out there, so ask around ut PSK31 and JT65 are 2 that are really popular.

Have fun!

Hi Larry,
Yes, more than likely. Telemetry as in satellite data? I havent done any of that so im not very helpful there.

Sorry Larry, catching up on e-mails tonight...

I used CAT5 cable with the connector, looked at the schematic of the back connector, figured out which was the VOX "pin", gound and MIC in pins, and what wires of the cable were in those slots, then used the pairings of the wires to run them to the pc. Made a seperate speaker cable out of a pair of wires I didnt use and it's been working great since.

I dont have the schematic in front of me, but it's very simple to read. The manual is easy to find online and download too, I know that much. Anyone who has any type of "circuit design" knowledge can do this in about 20 minutes. And very very low cost. Im cheap like that! :-)

Any more questions please let me know! QRZd me for direct e-mail(if its not listed here)if youd like to take this off the group??

It's not for me, it's potentially for the original poster, Hooman. I have manuals with pin assignments for the mic jack and ACC jack for both my IC-706s, but don't know what manuals the original posters may have.

From: John G.
Topic: 19540  Message: 19553

Yes that would be helpful. I should have included it earlier. The nice thing about the 706 (as opposed to most other rigs) is that you can get the receive audio off of the mic jack also, so you don't have to tie up the speaker or headphones jack.This allows for a single cable between the rig and soundcard.

On the RJ45 mic jack, Pin 3 is AF out, and Pin 7 is ground. These 2 go to the MIC jack on the soundcard. Pin 6 is Mic input, and Pin 5 is Mic ground, these 2 go to the headphones jack on the soundcard. The AF out level is controlled by the volume knob on the rig, and is not a fixed level like on the ACC jack on the back of the rig.

# 19554. IC706MkIIG won't TX FM on VHF/UHF following TX expand mod.

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-10 19:54:51 UTC
From: Harry
Topic: 19554  Message: 19554

I've just opened up the TX freq. range by removing the middle diode from the designated row of 11 positions on the PCB. I can now happily TX on the upper part of the 40m band, which was the object of the mod. However, a down side was losing all my stored memories and the rig reverting to its intial configuration mode. Having reset all options to my satisfaction, I am now unable to TX FM on VHF/UHF frequencies, although SSB seems OK. When I key FM, there is an initial spike of power which then immediately collapses. The ALC also exhibits the same behaviour. Tests have been conducted using a dummy load. I'm not sure whether this loss of FM is related to my mod, or is coincidental, as I can't remember when I last used the VHF/UHF bands. Reception is OK on all bands. Does anyone have any suggestions as to what the problem might be?

>
Mystery solved! I was using low power settings (as a precaution) for testing. As I increased the power, all was back to normal. It does seem though that the lower power settings produce different results on SSB and FM.

The Icom 706 will put out a spike of full power each time it goes to transmitt.  The ALC will take over and then cut it back to where it is set.  You may not see this in ssb as there is not usually any sound going into the microphone to start with.

I can now happily TX on the upper part of the 40m band, which was the object of the mod.  However, a down side was losing all my stored memories and the rig reverting to its intial configuration mode.  Having reset all options to my satisfaction, I am now unable to TX FM on VHF/UHF frequencies, although SSB seems OK.  When I key FM, there is an initial spike of power which then immediately collapses.  The ALC also exhibits the same behaviour.  Tests have been conducted using a dummy load.  I'm not sure whether this loss of FM is related to my mod, or is coincidental, as I can't remember when I last used the VHF/UHF bands.  Reception is OK on all bands.  Does anyone have any suggestions as to what the problem might be?
>
Mystery solved!  I was using low power settings (as a precaution) for testing.  As I increased the power, all was back to normal.  It does seem though that the lower power settings produce different results on SSB and FM.

Thanks Ralph - I had already suspected that may be the cause of the spikes. However, it does appear that I still have a problem. TX on VHF/UHF is now intermittant (more off than on) on FM only, regardless of power setting. All other modes, including AM, work fine, so whatever is controlling FM mode (the modulator, maybe?)is erratic in operation.

There are some adjustments for FM.  I can not copy and past them to email but they are in the service manual that you can download.

Mainly you tune to 29.100 mhz, set the mode to FM and key the transmitter.  Then on the main board, connect a meter to check point CP1011, adjust C1022 for a value of 1.8 volts. That is on page 4-4 of the manual.  The adjustment point is about the middle of the top of the Icom 706 and about 1/4 the way to the back..

For the manual.  Be sure to get the one for the modle you have.

Many thanks for the helpful suggestions, Ralph. I will try and download a copy of the manual, as suggested. I bought the rig new, nearly 10 yrs ago and have never had any problems until performing the simple TX expand mod. I can't see that this mod has caused the problem, but who knows?

Hi all, I am a new member here, stumble across this list on a search for 706 stuff, thought I would get a lot of good info here. I am a fairly new ham, 2 yrs last month, have upgraded to general, and am thinking about trying for my extra. I am a retired carpenter, with poor vision, am having a great time in the hobby, have made some really good friends because of the hobby, who have helped my out a lot with problems. They have become a second set of eyes for me. I just recieved the IC 17, I want to use Ham Radio Deluxe with the new to me IC 706MKii that I have. Being able to make the stuff larger on the computer screen is a benefit to me, plus it will tell me what frequency I am on another benefit to me. Waiting for the cable to hook up the CT17 to my computer so I can get started and learn more about the 706 and its features. You all take care.

Managed to download a copy of the manual - brilliant document!
Followed the instructions for adjusting the FM VCO and it now looks as if I'm back in business! Before adjusting for 1.8V, I measured 2.5V, so obviously way out - perhaps not too surprising after 10 yrs of use. I don't think my TX expand mod had anything to do with this problem. A minor difficulty with the adjustment: I found C1022 extremely sensitive, with very small movements causing quite large voltage swings. Not sure whether this is normal or indicative of some underlying problem.

Thanks again Ralph for your excellent diagnosis and advice.

A nice link for CAT5 / RJ-45 and the 706:

http://mysite.verizon.net/cpthaines/id67.html

Nice chart of the pin outs, with pictures and the color-codes for CAT5
Cable, so those of us with horrible eyes don't even have to count the
pins...

On Sat, Mar 10, 2012 at 10:35, John G. <af5cc@...> wrote:
> Yes that would be helpful. I should have included it earlier. The nice thing about the 706 (as opposed to most other rigs) is that you can get the receive audio off of the mic jack also, so you don't have to tie up the speaker or headphones jack.This allows for a single cable between the rig and soundcard.
>
> On the RJ45 mic jack, Pin 3 is AF out, and Pin 7 is ground.  These 2 go to the MIC jack on the soundcard.  Pin 6 is Mic input, and Pin 5 is Mic ground, these 2 go to the headphones jack on the soundcard.  The AF out level is controlled by the volume knob on the rig, and is not a fixed level like on the ACC jack on the back of the rig.

Thank you Harry, I am glad to hear this is the right place, and I read your exchange with Ralph. That is one of the best things about this hobby, is the willingness of other hams to help you out of a problem, heck you can get so much help that they almost fall over each other trying to help. Just love it. The 2 shorts years that I have been in the hobby have been so much fun, didn't know that an old ggggeeeezzzzeeeerrrrr could have this much fun.
Take Care

Glad that solved the problem for you Harry.

Thanks for letting us know.

I read about that several years ago and not long after, a local ham had the same problem. I adjusted it for him and his worked fine after that.

I doubt that you mod had anything to do with it.  Maybe something did manage to hit the adjustment screw and bump it off.  Many radios have crappy pots and capacitors in them and just seem to get off after the years.

For digi modes, you'll want the 350 Hz filter. That's the easy one. For SSB, there are two choices. I put the wide filter in and like the better fidelity. If you're after better selectivity, then get the 1.8k narrow filter. More of a preference kind of thing.

From: David Westbrook
Topic: 19568  Message: 19568

Trying to get VOX to work on a IC706MKII ... i haven't used VOX on it before, and the previously owner didn't either.

VOX will go to TX just fine (and the vox-delay & vox-gain seem to behavior appropriately) ... but the instant it drops to RX, TX gets re-triggered, and it loops (and can hear the relay chattering).

I have hit up the manual, and know there's variables of:
Mic Gain
VOX on/off (M menu)
VOX Delay (quick menu)
VOX Gain (pot on side panel)
Anti-VOX (pot on side panel)

Have played with various combinations but to no avail ... have tried both the IC stock mic, and a heil headset ... using dummy load & low power while testing.

Any tips on debugging, or procedure (e.g. setting everything all the way one way) to start out and find the right setting?
Possible culprits? (the relay rclick re-triggering? RF? etc)

thanks,

# 19572. Odd IC706 Mk II Power Output

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-13 03:14:39 UTC
From: ka9p
Topic: 19566  Message: 19572

HI -

I picked up a used 706 MK 2 a few weeks ago and finally got around to taking a look at the output on my wattmeter.

Into a good dummy load I'm getting 150 watts out on 80 meters and around 70 down at 10 meters, with the power rolling off through the bands in the middle>

Does this sound like a fault, someone fiddling with the power output, or?

Any thoughts appreciated - the radio is perfect otherwise - my concern primarily is that if this is an indication of an imminent fault I'd like to know arther than rely on it on a long trip.

Thanks and 73, Scott

I've never seen more than 100 out of my 706G and that's pretty consistent through the hf bands. What kind of watt meter?

From: g3sdy@aol.com
Topic: 19566  Message: 19576

Hi all,
The narrow filter helps cut down adjacent channel QRM especially useful on 80m and 40m when operating mobile or trying to work QRP stations on a busy band.
It is possible to simulate the missing High audio frequencies (try using the IRT control) or a diode accross the ext speaker to generate a few audio harmonics!!!

73 Gerald g3sdy

For digi modes, you'll want the 350 Hz filter. That's the easy one. For SSB, there are two choices. I put the wide filter in and like the better fidelity. If you're after better selectivity, then get the 1.8k narrow filter. More of a preference kind of thing.

Joe, N3JI

Sent from my Verizon Wireless Android

Hello
       My 706mk2 G has output power of 115 watts on 80 meters, and 105 watts on ten meters, the radio is 8 years old, I have been told it was normal for valved sets to be like this, power reduced as frequency increased,

Had anti-vox at max, and turned down vox-gain until it no longer started TX
... same issue.

It seems to have the same "chattering" behavior for any combo (where
vox-gain is sufficient to trip TX) of vox-gain & anti-vox ...

thanks,

David,

Try your test again but this time use head phones to eliminate any possibility of the speaker audio being fed back to the mic. Let us know the results.

RF on the audio?
shorten the leads, add ferrite test again?

RF on the mic line is a good possibility. Here is another test.
Disconnect the mic, shut off the VOX, and manually key the transmitter.
Do you hear anything in an adjacent receiver tuned to the transmitting
frequency? Let us know the results.

# 19584. LDG AT-7000 tuner and MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-15 13:15:05 UTC
From: Don
Topic: 19584  Message: 19584

I got this AT-7000 the other day...hooked it up..seems to be working. The LDG manual is focused towards the IC-7000. Can't figure out if the tuner can go to bypass or does it not have that function on the MKII...SWR always reads about 1.3:1 even without re-tuning after changing bands and the PTT tuning (Q13) is off. Tuner/call button blinks once when i tune it up. doesn't respond like the 706 manual says but that's with an ICOM AH...

Seems to be RXing ok...

I did buy the MKII as a basket case and found that the ant tuner plug had exceeded the 1 amp rating and burnt the circuit board trace. Fixed that and everything else seems normal.

this is my first automatic ant tuner,,,,not sure what to expect. I'm a tube guy and need meters and lights and lots on knobs to feel comfortable.

# 19585. Re: [ic706] LDG AT-7000 tuner and MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-15 20:00:29 UTC
From: Larry J. Ford
Topic: 19584  Message: 19585

I seem to recall reading there is a difference between the auto tuner port on the IC-7000 vs. the autotuner port on the IC-706. So much so that those "tuner emulators" that plug into the autotuner port have to have a different version for the 7000.

"Here are important caveats about the IC-7000. The port on the rear apron of the IC-7000 designed to interface with the AH-4 auto coupler is configured differently than the IC-706 series. Pin 1 (TKEY) input is shared internally with the temperature control circuitry. This pin must be left floating. If it isn't, the fan will not come on as required, which can lead to final and/or CPU failures! Pin 2 (TSTART) should not be brought to supply levels (?13.8 VDC). While you can barely get by doing this to an IC-706, doing so to an IC-7000 will eventually damage its CPU. If you're building an interface, then here is the correct way to do so."

"Devices used to mimic the AH-4, and trick the IC-706 into transmitting 10 watts of carrier are not necessarily compatible with the IC-7000. This includes the suggested circuitry from SGC, at least one of the older model screwdriver controllers, and most small tuner modules. The only US made one known to work correctly is from Better RF, and designed specifically for the IC-7000. Their older IC-706 model is not compatible. There is also an Australian one designed by Owen Duffy, VK1OD, which is compatible. If you are using one of Bob Lewis' (AA4PB) Ham-Kit interfaces, remove R1 (33k) entirely, as it is not needed. For more information on these devices, read the Antenna Controllers article."
(Source: http://www.k0bg.com/couplers.html )

There's more here: http://www.eham.net/articles/14553

If that AT-7000 was truly set up for the IC-7000, it may need changes to the interface wiring to work correctly with the 706. Does the manual contain any references to using the tuner with OTHER than a 7000?

Subject: [ic706] LDG AT-7000 tuner and MKII

I got this AT-7000 the other day...hooked it up..seems to be working. The LDG manual is focused towards the IC-7000. Can't figure out if the tuner can go to bypass or does it not have that function on the MKII...SWR always reads about 1.3:1 even without re-tuning after changing bands and the PTT tuning (Q13) is off. Tuner/call button blinks once when i tune it up.

doesn't respond like the 706 manual says but that's with an ICOM AH...

Seems to be RXing ok...

I did buy the MKII as a basket case and found that the ant tuner plug had exceeded the 1 amp rating and burnt the circuit board trace. Fixed that and everything else seems normal.

this is my first automatic ant tuner,,,,not sure what to expect. I'm a tube guy and need meters and lights and lots on knobs to feel comfortable.

Thanks for the reply Larry...i read that web site before from K0BG...nice write up. I think site is geared more to the fragility of the IC-7000 to the antenna tuner output plug nad using screwdriver type antenna controllers. The 706 is almost as fragile but has a little more oomph. My 706 works great with the BetterRF tuning slug in the tuner output and my big old home brew manual antenna tuner. Transmitter drops to 10 watts and I can pull the SWR down to 1.3:1.

I shot an email off to LDG to see if they have any words of wisdom. Since schematics are pretty rare for these puppies and i paid for a working unit, I'd rather get my money back for tuner a go look for something else.

I'll post LDG's reply maybe it would help someone else later on.

From: kd8dvy@ymail.com
Topic: 19587  Message: 19587

GD All,

I am writing this in regards of a fellow HAM and her start-up internet/ebay business! Where, she makes 4:1 baluns and will hopefully branch off into 1:1; 9:1 and antennas as well! She have sold 4:1 baluns at HamFests in the past and the people who have purchased them report that they work as well if not BETTER than the traditional commercial baluns.

Check out our product on e-Bay:

http://www.ebay.com/itm/NEW-4-1-BALUN-Flat-across-ENTIRE-SPECTRUM-80-6-/290684554366?pt=LH_DefaultDomain_0&hash=item43ae264c7e

(The pic is actually bigger than the balun is.)

Thanks and 73s!

# 19588. 706MKIIG CW transmit with very low power

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-16 18:34:38 UTC
From: vidorrete
Topic: 19588  Message: 19588

Hi, I am owner of an 706MKIIG s/n 13677, works fine in alla modes all bands, tryed today to use it in CW with Straight Key.

Carefully followed all note rgarding jack (see manual page 5), and settings Q4 CW PADDLE: OFF (see manual page 33).

Beep/Sidetone adjusted and perfectly udible.

All seems fine, but power trasmission is negligible in spite of any RF POWER SETTING (Q1).

Also need to add that it works exactly the same (e.g. very low power), also using the microphone with Q4 CW PADDLE UP (and keyer jack disconnected).

Anyone can help me ?

Kind regards, IW4BKX

# 19589. Re: 706MKIIG CW transmit with very low power - Fixed !

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-17 06:49:12 UTC
From: vidorrete
Topic: 19588  Message: 19589

Hi,
I finally found a solution and the problem is now fixed on my 706MKIIG

I slightly changed setting of TRASMITTER ADJUSTMENT (R921).

This adjustment point is easily accessible opening the upper cover, as described
in IC-706MKIIG Service manual, chapter ADJUSTMENT PROCEDURE.

After this change all is working fine and CW transmitting power is as expected in all bands,
using both straight key or microphone up/down.

Regards, Alberto IW4BKX

# 19590. Re: LDG AT-7000 tuner and MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-19 01:13:45 UTC
From: Don
Topic: 19584  Message: 19590

Got my problem figured out...a bit. Brought in my MKIIG from the car and the AT-7000 worked fine. So the MKII has a problem with the tuner plug circuitry. I did a quick resistance check between the MKII and the MKIIG 4 pin plugs and see some differences in the TKEY line and the TSTR line.
TKEY TSTR
MKII 3.9K .45M

MKIIG 48K 1M

IF anyone has a MKII on their bench that can throw an ohmmeter on the tuner plug and verify these readings i would appreciate it. Haven't looked at the MKIIG schem to see if the circuits are the same yet. It looks like the TKEY line has some issues.

thanks don

# 19591. mkIIg snapping when using headphones

Yahoo group: ic706 (2010 — 2015)
Date: 2012-03-20 15:57:58 UTC
From: hahollme
Topic: 19591  Message: 19591

Hi!

I bought an used mkIIg and it seems to work just fine except when using headphones there is a snapping sound when using ptt or sending cw. Therefore sending qsk cw is very annoying because of the constant switching between rx/tx, and therefore snapping. I've tried with two headphones and a couple of mics.

Best,
Hannu

On this list and several other Yahoo group listserves, I'm getting a copy of what I post to the listserve on a timely basis delivered back to my e-mail client.

However, there is one Yahoo group on which my postings don't come through on the listserve for several hours, if at all, and I'm trying to figure why (unless I've been "moderated" and don't know it! ;-).

I have seen that myself and had assumed is was personal.
To paraphrase Groucho Marx "I wouldn't want to be a member of any group that accepted posts from people like me" (almost true)

I assume many groups must have active moderators some in time zones different to our own.
Also some ISP's anti-spam systems reject mail once to get it re-sent (spam will rarely get re-sent) that could add a delay.

From the polite tone of your first post I am going to put my money on "normal system lag" rather than personal in your case.

Those who need moderating rarely consider it a possibility.

I found that two different ISPs would keep bouncing messages from Yahoo Groups (even though I had specified that I did not want them to do any Spam/virus checking), alleging that they were Spam, with the result that Yahoo would quit sending any more messages. I now use a Yahoo email address for all my Yahoo Groups subscriptions (and only for that purpose), and that has solved that problem.

From: Brandon
Topic: 19599  Message: 19599

I have a 2g model that won't power on. It was working via the power supply switch but I had to unplug the unit in order to move it an now it will not turn on. I've checked the connections (obviously) and the internal fuse (intact). This happens to be the second 2g that this has happened to. I ended up cannibalizing one to get the other working.

Before I end up spending money on this radio, does anyone have any ideas as to what the problem could be and if a fix could be performed at home vs. shipping to an Icom Service Center?

O.k. stupid me. The positive side of the power cord wasn't making a good connection at one end of the inline fuse. I totally forgot that the wire was prone to come out hence no power.

Now, unfortunately, I've lost the sound and some of the other functions on the control panel. I can switch between the various functions but cannot change the memory channels or adjust the sideband bandwidth. The VFO works and can switch between bands. There is no squelch function either. Absolutely no sound. Anyone have any ideas?

BTW, I think this group is great. Keep up the good work.

If its no audio from the speaker, slide the head off and make sure you didn't hit the "SPEAKER" / "PHONE" switch to phones.....I've done that a few times.

opps...wait...that's for the external speaker not the internal. I forgot that i had that problem in the car.....not in the house.

I assume it's the internal that your having the problem with.

# 19604. 706- Power Spikes

Yahoo group: ic706 (2010 — 2015)
Date: 2012-04-09 15:04:56 UTC
From: Jim Stewart
Topic: 19604  Message: 19604

Icom 706 Serial 04553 new in 1998 and never missed a beat since.

Recently added Ameritron ALS 600 amplifier with ALS 600PS together with ARB 704 Interface Buffer and recommended connecting cable PNP-13D.

Significant voltage spikes on keying up in cw mode. Ameritron advise that some 706, implied older models, had a problem in this respect and to refer to Icom.

Anybody with a solution or comments please.

Jim Stewart 5Z4FM

I am not sure of your question.  If you mean the Icom 706 puts out a spike of RF and then cuts the output power back, that is normal for the Icom 706.  I do not know of a way around this.

This "leading edge power spike" is a noted, well-known characteristic of the original 706, the 706 MKII (the two models that I have), and, for all I know, the 706MKIIG as well.

The issue can be found in other ICOM models as well, although it is exhibited to a much lesser degree in the ICOM IC-7200, which is the rig I mostly use to drive my Ameritron ALS-600.

In order to attempt to use either the original 706 or the 706MKII to drive the ALS-600, I have research several solutions, including the following by Phil Salas, who has written about this problem extensively:

http://www.ad5x.com/images/Articles/HiPwr%20Pad%20RevA.pdf

http://www.ad5x.com/images/Articles/Overshoot%20Protection.pdf

I am currently adding another gas discharge tube to the device in the second article to suppress the power spike on the 706 for use with my ALS-600.

Hope this helps.

If you can run it full power there may not be a spike but anything less their will be for sure.

Even the newest icom 7410 has this problem. A good way to cook ceramic tubes.

Some have built attenuators to tame the beast.

I have an Ameritron ARB-704, along with the ALS-600 and 706, essentially the same set-up as yours, and there's no way the ARB-704 amp keying "buffer" can deal with an RF spike from the rig used to drive the amp - there's no RF connection from the rig to the ARB-704.

The ARB-704 is designed to with two situations primarily:

1. For newer, solid state rigs with amp keying relays that cannot withstand the higher key line voltages present on the keying relays on the older amps of previous generations (e.g., original Heathkit SSB-200s, etc); or,

2. For rigs that have NO amp keying relay, such as the 706, which require an interface of some sort to key an amp.

The ALC line on the ARB-704 is simply a "pass-through" circuit, but wouldn't help the leading-edge power spike prevalent on the 706s.

Having another problem with my 2g, I have no audio. There's no audio coming out of the speaker, front headphone jack, or external speaker jack. Along with this the bandwidth adjustment knob and squelch knob don't work. Everything else seems to work (so far).

Anyone have any ideas?

Thanks in advance,
Brandon, KB3VYD

Jim - Take a look at my article "Attenuator for transceiver/amplifier interfacing" in the "Articles" section of my website at www.ad5x.com. I assume your '706 is putting out a full power first-dit spike when turned down to the 60-65 watts needed to drive the amp. This was a problem on the IC-706 and IC-706MKII. My IC-706MKIIG overshoots 6-7 watts or so when turned down, but the older radios put out full power (or more) regardless of power setting. I measured this spike duration at about 2ms. If your '706 puts out much more than full power, then take a look at the "Amplifier Overshoot Protection" article. I used that approach with my IC-706MKII which would spike to 140 watts regardless of power setting.

Phil - AD5X

# 19616. FS: MFJ-706 EMCOMM portable package for IC-706

Yahoo group: ic706 (2010 — 2015)
Date: 2012-04-16 18:23:54 UTC
From: phil_ad5x
Topic: 19616  Message: 19616

Up for sale is my MFJ-706 portable package as shown in the "Product Reviews" section of my web-site at www.ad5x.com. The MFJ-706 is a grab-and-go hand-carried EMCOMM-type package for IC-706 transceivers, and is easily modified for the IC-7000 as shown in my website article by changing the DC/transceiver connector in the MFJ-706. I've added the internal PowerPole interface as shown in the article, and also have included a PowerPole pigtail so you can add your IC-7000 connector. The MFJ-706 includes a carrying handle, long-wire and coax HF connectors, VHF/UHF connector, and an internal wide-range antenna tuner. It also includes an internal voltage conditioner that provides over-voltage, reverse voltage and transient protection, and unique filtering that permits operation from poor or under-powered voltage sources ☐ even an auto accessory socket. Some eHam reviews can be found here: www.eham.net/reviews/detail/8501. This MFJ-706 includes the modifications detailed in my website review: front-cover
thumb-screws, improved internal wiring, PowerPole chassis connector,
PowerPole-to-Accessory Plug adapter, a 6-ft PowerPole power cable, CW key jack, and a ground lug. Everything works great. Price is $275 shipped/insured in the US. PayPal, check or money order accepted.

Phil,

Would you consider a trade for a "new-in-box," never used AH-4 tuner for that MFJ-706? EMCOMM Kit? AH-4 was only taken out of box to install a PL-259 connector. Pristine condition.

# 19621. FS: Icom 706MKIIG

Yahoo group: ic706 (2010 — 2015)
Date: 2012-04-19 15:42:20 UTC
From: John G.
Topic: 15537  Message: 19621

I have for sale an Icom 706MKIIG in very nice condition, with the mic, box, and a photocopy of the manual. It works fine, and looks very good with a couple of light marks on the top of the case, and some very light scratches where the mobile bracket was once attached to it around the holes on the sides. I don't have a power cord with it, but those are readily available. It has a later serial number so it has the newer finals in it.

I am asking $610 shipped in the US and can take paypal/check/MO.

Hello All,

I am a new member to the iCom IC706 group and wanted to say Hi. I recently purchased a ic706MKIIG and I will be powering it up tonight, but I have a question for the collective brain trust here. I have a Kenwood PS30 power supply that has the same voltage pinout as the IC706 plug with the exception of the last two pins on the molex connector, will that power supply work on the MKII? The voltage and amperage all look good, but the other two pins concern me a bit.

I have been a HAM for less than a year and will be taking my Extra exams in May.

Regards, Dave KF7RXO

I have for sale an Icom 706 original HF/6m/2m transceiver. This is the version that does 100 watts on HF and 6m and 10 watts on 2m. It has some scratches on the case from going mobile, but works fine with one exception-the meter doesn't work on transmit. It reads very low on 160/80 and higher as you go up in frequency, but still low. It has been opened up for 60m as well. I have worked 186 countries on it in the past 13 months so it is doing fine.
It comes with the box, manual, and hand mic. There is no power cord with it.
I am asking $325 shipped and can take paypal/check/MO.

On the 706mk2 cord, two are positive, two are negative, two are empty. I would pop the top on the radio and see if the pins in question are not connected to anything.

Hi, You may find the two extra pins on the power supply lead is for when it's connected to a Kenwood radio, the kenwood will controll the power supply, but that power supply should be ok for a 706mk11g. If you use the correct pins.

Many thanks to David and Mike,

I found that the third two pins on the power connector were actually shorted together inside the ic706 and it instantly turned on the power supply when I plugged it in, but that is OK.

Again, thanks for the info and hope to be an active member on this group for a long time.

Regards, Dave KF7RXO.

Check it out first----------but---------if the power supply fails to turn on it MAY require shorting those two extra pins (on/off control as David says). Check it out first though so you don’t let the magic smoke out of the power supply.

# 19629. Re: IC706MkIIG won't TX FM on VHF/UHF following TX expand mod.

Yahoo group: ic706 (2010 — 2015)
Date: 2012-04-21 12:11:23 UTC
From: Harry
Topic: 19554  Message: 19629

A further update on this problem:
TX on FM is still proving erratic. I have had to re-adjust the VCO several times to maintain operation. Stability seems to be temperature dependent, so I have have found it necessary to calibrate the VCO after the rig has warmed up (doesn't take very long). However, when initially switching on from cold - no TX. There is obviously something in the circuit which has become sensitive to temperature; could it be C1022 itself, or are my adjustments just trying to correct the effects of some other component drifting?

--- In ic706@yahoogroups.com, "Harry" <g7knk@...> wrote:
>
>
>
> Managed to download a copy of the manual - brilliant document!
> Followed the instructions for adjusting the FM VCO and it now looks as if I'm back in business! Before adjusting for 1.8V, I measured 2.5V, so obviously way out - perhaps not too surprising after 10 yrs of use. I don't think my TX expand mod had anything to do with this problem. A minor difficulty with the adjustment: I found C1022 extremely sensitive, with very small movements causing quite large voltage swings. Not sure whether this is normal or indicative of some underlying problem.
>
> Thanks again Ralph for your excellent diagnosis and advice.

> > >
> > >
> > >
> > >
> > > Thanks Ralph - I had already suspected that may be the cause of the spikes.  However, it does appear that I still have a problem.  TX on VHF/UHF is now intermittant (more off than on) on FM only, regardless of power setting.  All other modes, including AM, work fine, so whatever is controlling FM mode (the modulator, maybe?)is erratic in operation.

ok it's a wierd one..
here goes
1 when u power up it goes into CPU reset mode and ends up at 14.100
2 the band up down buttons don't work as band up /down BUT if there needed for other functions they work..
3 not able to get into main menu ect

it's like "whatever the term that the CPU Or eeprom see's is driven hard on or off depending it's requirement

thanks

Sounds like the EEPROM unit might have been corrupted by the lightning. Does the radio remember all settings if you turn it off, but leave the power supply turned on?

Icom IC-706 original model, good used condition, with hand mic and short (like 3 ft) power cable. Has some scratches on covers but the face is still pretty. MARS operable. $450 (USPS money order only) buyer pays shipping CONUS or swap for good condition IC-703 or IC-765.

Looks like it time to change Yahoo passwords again! Does anybody have any idea what is giving the info to the spammers? Is it opening the link which is being advertised?

# 19649. Dim backlighting?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-04-30 20:11:43 UTC
From: svenskadude
Topic: 19649  Message: 19649

Hello All,

I have a question about my ic706MKIIG radio and thought you all would rather sink you teeth into it rather than read SPAM. My radio's backlighting seems very dim on the buttons with respect to the Screen. I have checked the initial power on settings, and the backlight is set at high, but it still seems low. Is there some sort of Mod to increase the button backlight?

Regards, Dave KF7RXO.

Good point, they seem to be but I will clense them, what will clean them without melting or deforming them? How about laptop screen whipes?

Thanks, Dave. KF7RXO.

I've used baby wipes without any problems on my 706, but it's up to you what to use. I'd hate to tell you something is OK, only to have it melt your radio.

I'd try a very soft cloth, like a baby cloth moistened with only water.

Baby wipes do a great job on poop. If your 706 has baby poop on the mode switches then with baby wipes you're good to go! [?]

Baby wipes do good on biological messes, poop, of course, but also oils and debris from fingertips. I use them to clean the surfaces in my trucks, boots, hands, equipment picked up at thrift shops... On windows, lenses and such, baby wipes usually leave a white film from the aloe, but it gets the crud off. Once a week or so I use a wipe to clean off the leather covered steering wheel in my truck and the gear lever.

Thanks for all the suggestions guys, It has been a long time since I had to use a baby wipe, but it does seem like a good solution. If the backlighting does not come back up, I will check the lighting voltage, maybe it is a little low.

I wouldn't worry too much about it. I don't think the buttons are
supposed to be very bright. They aren't supposed to be so bright that
you can read them in the dark. More, they are so you can put your
finger in the right place in the dark. Mine aren't bright either, and I
wouldn't want them any brighter.

# 19658. Icom 706MKII question

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-01 19:18:12 UTC
From: John
Topic: 19658  Message: 19658

On the Icom 706MKII (not the MKIIG) can you have the filter settings different on each VFO when running split? I have an Icom 706 original, and if you use the narrow CW filter on VFO A, VFO B will also use the narrow filter. I know on the MKIIG you can have different filter settings for each VFO, but how about for the MKII? When running a split frequency pileup on CW, I like to have the narrow filter in line for the receive frequency to hear the DX, but it is nice to have the other VFO (the transmit one) in a 2.4khz bandwidth so when you use the XFC button you can find the station he is working easier. I have resisted putting the 250hz CW filter in my 706 original and stuck with the 500hz one due to this limitation.

# 19659. Location of low pass filter

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-08 23:09:02 UTC
From: John G.
Topic: 19659  Message: 19659

I am looking at doing a little upgrading in some parts of the station, and have a question about using a low pass filter. THe current one I have is between the rig and antenna tuner, which seems to be the common place to put one. Can a low pass filter go on the other side of the tuner-between the antenna tuner and the antenna, or might that mess things up since the tuner might now see the low pass filter as the load?

From: Ralph Mowery
Topic: 19659  Message: 19660

It is best to put the filter between the transmitter and tuner.  That way  the filter is looking into a 50 ohm load like it is designed to.

Why are you using a filter anyway ?  The rig should be clean enough, and if using a tuner, you often get aditional filtering with it.

No. The filter wouldn't work properly when terminated in other than its design impedance. With a tuner, it's safe to assume your antenna isn't 50 ohms so putting the filter between the radio and tuner is the correct place.

Low pass filters don't attenuate until about 40MHz. If your HF equipment is generating any harmonics, most of that energy would be well below that cutoff making the addition of a low pass filter unlikely to do any good. The corollary to that is if your equipment is generating significant harmonics above 50Mhz, it's broken - you don't fix it with an add-on filter.

The previous responses are correct. Install the filter in a location with a known 50 ohm load [between the radio and the tuner].

Regarding the comments on harmonics. All amplifiers, even Class A linear, generate harmonics. The power devices are not perfectly linear. Therefore harmonics are generated. The differences are in the amplitude of the harmonic energy ... typical examples ... -10dBc for unfiltered Class C to -15 dBc for Class B to -20 dBc for Class A,. etc.

Amateurs have a responsibility NOT to create interference to other spectrum users. A LP Filter is added insurance in complying with that requirement.

BTW: I have used my old Drake LP-1000 and LP-3300 for more than 50 years.

Anything sold into the amateur market is spec'd to -43dBc or better to be legal, and by the time you go above the third harmonic you will be far below that, making a low pass filter superfluous. Sure, if you're operating 15M and up the more powerful harmonics will be attenuated by the filter, but they should already be at -43dBc or less. On lower bands, the strongest harmonics won't even be touched by the filter so it's not a blanket solution for out of spec equipment.

Probably doesn't hurt to have one, but it's not helping anything either if the equipment is working right. I would only consider it if there were a specific interference issue to be mitigated that could be directly attributable to harmonic energy from a properly operating station. Chances are if there's an interference problem, it's fundamental overload and not harmonics.

Hi John

Yes they definitely do have a use. I think it is mainly for receive filtering of strong out of band signals that can swamp your radio Rx. For example you might me working 80m and you neighbour may be using 40m. They are also good for filtering the output of HPAs that do not have internal filtering. They don't do much for the transmit signals of commercial radios that are working correctly.

WRONG! Unless you are confused and thinking this thread is about the tuner and not the low-pass filter, you need to go back and read what the specs are on a typical low-pass filter. They only filter starting (usually) above six meters. They are not going to help save you from another HF station in another HF band.

Two reasons you don't need it... First, it isn't going to help you unless you have something wrong. Second, there is LOSS through the filter, just like there is through a tuner or anything else you put inline. It may be minimal, but why give up part of your signal for something that isn't doing you any good? And, if you do have something wrong and are putting out some spurious, you need to find it and fix it. It will normally show up as a high VSWR where you normally have a good match. It may even show up as a puff of smoke. Fix the problem, not the symptom.

# 19669. Update of the popular SDR (MDSR) software now available

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-09 19:25:20 UTC
From: alexschwarz237
Topic: 19669  Message: 19669

Hi Everybody;

We have finally finished the V2.4 and it is now available though the MDSR Yahoo user group. It will also be available through our official MDSR webpage. It can be found in the MDSR V2.4 folder in the files sections.
Everybody should update to version 2.4. to get the latest benefits of the MDSR development. Before installing close the MDSR application if you already using MDSR. Installation will take a few minutes. All the calibration and setup data will stay in place.

MDSR improves reception quality by using IF-DSP technology. An analog radio can be retrofitted with this software. MDSR provides a spectrum analyzer and IF-DSP features only found in high end amateur radio equipment.

http://groups.yahoo.com/group/mdsradio/ MDSR Yahoo user group

http://users.skynet.be/myspace/mdsr official MDSR website

What is new?
☐ Will install on WinXP, Vista and Win7 (32 and 64bit)
☐ Support for the Arduino Frequency counter (instructions and firmware are included in this release).
☐ Improved GUI
☐ Improved filtering
☐ Updated help files
☐ Some bug fixes ☐ reported by users

All the software and source code is free as long as it is used for HAM radio.

Thanks;

Alex

It's a swiss army knife radio. Not the "best" radio for many applications, but can work all the popular bands and is all-mode. I wouldn't want one as a primary home radio (the receiver can't handle a decent antenna) but as a radio you can use mobile or portable you get a lot of bang for the buck.

Mark,

Would you care to elaborate on your statement that the 706 "... receiver can't handle a decent antenna." I'm particularly interested in your definition of "handle" and "decent." Not trying to pick a fight, but just curious.

I had an "original" 706 as my primary (and only rig) for a number of years, and it was perfectly adequate for my level of use at the time. Of course, I was not a contester, nor trying to do "moon bounce" or any number of other more sophisticated uses.

I would recommend getting at least a 706MKII with the AF DSP module installed and a 1.9 KHz SSB filter if using it as a primary base rig (and the narrow CW filter if doing code). The AF DSP is not nearly the equal of the IF DSP in later ICOM rigs, like my 7200, but it's better than nothing! I still have that original 706, which could not accept the AF DSP module, and, compared to my 706MKII with the AF DSP installed, there's a big difference on the receive side in noisy conditions.

One of the great things about the 706 is that it's a "all mode" rig on every band, even 2 meters. One drawback is that the early models (706 and 706 MKII) were low power on 2 meters - 10 watts and 20 watts, respectively, and did not have 440 coverage - that came in the IC-706MKIIG, along with more power on 2 meters.

Paired with the ICOM AH-4 autotuner, you can have a fairly complete, easily installed HF/6 meter station with a random wire and decent counterpoise (need the MKII or MKIIG for the AH-4 to tune 6 meters). Plus, the early models are fairly easy to "mod" for operation on 60 meters or MARS.

A good, all-round rig for not a lot of money these days.

They are good radios. Icom sold a mint of them.
I have a mk2 and a mk2g but if I could afford it I'd go for something with I.F. Dsp so you can narrow the bandwidth.

If you do settle on a 706mk2g insist on Mittsubishi finals as the Motorola replacements are scarce and expensive.

I have a MKII that I purchased several years ago used. Is it a 746 Pro or a 756 Pro III?? Hell no, but for what it is, it works great. Coupled with a decent antenna and if necessary a good tuner, you shouldn't have any problem pulling off 8000 mile ssb qso's. It's also a pretty decent rig to use for digital modes. Running WSPR one time on the lowest power setting, I was getting out 10's of thousands of miles - amazing.

I've worked South America, Japan, and coast to coast in the US (and Alaska and Hawaii as well) with a Gap Titan vertical. It's not a mega-thousand dollar radio, but for what it is it works well.

Get a MK2G or you might even consider an IC-7000 as an alternative. They're all good radios.

I'd have to take exception to this statement. Just what do you consider "handling" and what do you consider a decent antenna?

I wouldn't want it as my only radio, because I like a big land yacht sitting on my desk. But the handling of strong signals has not been a problem, and I haven't had any intermod. I have NOT run it mobile, so I haven't been into the middle of Denver or anything like that to see if there is a problem there. If there was, I certainly wouldn't hold it against the radio. Anyone who operates in that environment is not surprised when something like that happens. I certainly wouldn't hold it against the radio. And by the way, I almost NEVER turn the preamp off. I operate CW and SSB on all bands but 160 these days. I turn off the preamp on the lower two bands only.

This radio has better sensitivity than many, possibly lacking on 432. I haven't checked out the sensitivity on 432 however.

I think your statement is a bit broad and vague.

Just my two cents worth.

Topic: 19668  Message: 19676

I have an Icom 706 original as my only radio in the shack right now. Been that way for 13 months now. I have had in the past a Yaesu FT1000MP (overrated), Kenwood TS950SD (should have kept it), Kenwood TS950SDX, and an Icom 756PRO2. I don't find the receiver in the 706 to be that far behind the others, for its size and price, it is amazing. I am using a homebrew dipole currently for an antenna, but have worked 192 countries and 38 CQ zones with my 706 original in the past 13 months. Worked 7O6T in Yemen on 20 CW last night, and 15 CW last Sunday. I have run it in quite a few contests as well. The secret is to leave off the preamp on 17m and below, and leave off the NB when the band is crowded.

I wouldn't get a 706MKII or MKIIG just because of the AF-DSP, it isn't anything to write home about. One problem with the MKIIG is that it is too sensitive for most home usage. Even with the preamp off, you are going to be listening to a S7 or so noise level on most bands. That might be ok with a really bad mobile antena, though. That is one nice thing about the 706 original, it has a more reasonable level of sensitivity. Leave off the preamp and it is just right on the low bands. You hear plenty of signals but not much background noise.

Also, the fan runs all of the time on the 706 original, which keeps it much cooler than the MKII and MKIIG, where the fan doesn't run unless the rig gets too hot. I prefer a cool rig, they last longer. The 10 watts on 2m is perfect for driving most amps.

Do I like my 706 original? Since trading for it last March, I have picked up an Icom 746PRO, 2 Icom 706MKIIGs, and a Yaesu FT450. They are all gone, and it is still here.

Welcome, Tom! I started out with an IC-735 myself and now have had my IC-706MkIIg for over 10 years. I am planning to get an IC-7000 maybe later this year.

The IC-735 was a very basic radio. It only had 10 memory channels, and only had bands 160m-10m. The 706, besides being more compact, has many more memory channels and also includes 6m, 2m and 70cm, all modes. It has an audio DSP which isn't all that good; I supplement it with an Amcom DSP speaker which greatly improves things (it's now sold by West Mountain Radio as the "ClearSPKR ClearSpeech"). I also got the narrow SSB filter for mine. The automatic notch filter works very nicely, though.

The 706 came in several models. I think the first one didn't have 70cm and later ones added that band and later, more power on VHF. Although this line is now discontinued you will still see many for sale.

The reason I am looking at the IC-7000 is the IF-based DSP, which is supposed to be really good, two manual notch filters, and DSP-based fully customizable filters; also a voice and CW keyer and lots of other improvements. But I do not plan to sell my 706, I think I'll keep it so that I can work analog satellites with it or just to have two HF radios around.

Dave,

I have had several IF-DSP based rigs, including a 7000, and the noise reduction in them still isn't anything to write home about-really doesn't do much. Even though it is as the IF level, and inside the AGC loop, I have never seen it actually lower the S meter reading on noise, as it should. Also, the DSP based filters in the 7000, which they do allow for more flexibility in setting the bandwidth, don't appear to work as good as the crystal filters do in the 706 series.

Go read the article about IF-DSP rigs at

www.sherweng.com

Rob Sherwood is considered the guru of receiver testing performance, and he sold his 7000 to get a MKIIG back instead.

> interested in your definition of "handle" and "decent."

"Handle" in this context is the ability of the receiver to accommodate the signal levels being presented to it without degradation. "Degradation" in this case would be products of IMD. With the (my) 706MkIIG that manifests itself in hearing the same CW signal multiple places across the band, and "crunching" from SSB signals both close in, and not so close in.

"Decent" is an antenna at least as good as a dipole or a full length vertical. I noticed these effects with my butternut vertical, and moreso with my tribander. At one point I was using my 706 as a secondary rig in my station and could readily duplicate the issues swapping antennas around. These effects are not observed on my 746.

6M is worse. When there was an active TV channel 2 in ABQ the receiver was unusable. I had to make a pass-notch filter just to be able to hear anything. Again, not a problem on my 746 using the same antenna.

In the case of the HF issues, it doesn't render the radio unusable, just that when band conditions are good and there are a lot of strong signals on the band, you will find IMD products across the band. Some may notice, some may not. Some may care, some may not. On a compromise antenna like an HF mobile setup you would never see this problem.

As a "swiss army knife" radio it's tough to beat and I have used mine mobile, fixed and portable for over a decade. I know people can sometimes get defensive when someone might pick a few nits about their favorite product but this is a reality when you put so much into a small package. To me, coupled with the small screen and layered menus keeps this rig in the category of secondary/specific use category and not as a primary rig.

See my previous post.

> I like a big land yacht sitting on my desk.

That's one of the reasons the 706 isn't an ideal primary rig. Constantly surfing the menus to select often used features gets old after a while. A knob/button radio is much more convenient, and a larger display allows you to control it at arms length.

> But the handling of strong signals has not been a
> problem, and I haven't had any intermod.

I have, routinely and repeatedly.

> I almost NEVER turn the preamp off.

That of course can accentuate the problem, though on HF a preamp usually doesn't help anyway (you're operating above the noise floor already). What I ended up doing was using the attenuator when signals are especially strong.

> I think your statement is a bit broad and vague.

It was a casual observation to an inspecific question. I can get as detailed as you like.

The "study" to which you are apparently referring on the Sherwood Engineering website (i.e., the presentation at Dayton 2007) was at least 5 years ago (2007) prior to the development and introduction of the ICOM IC-7200, which I have, along with an original 706 (which cannot accept the ICOM AF DSP module), and an ICOM IC-706 MKII, which has the AF DSP module installed.

As I posted earlier, the 7200 has IF DSP, and I have noticed none of the complaints Mr. Sherwood made in his presentation about IF DSP rigs extant in 2007. Perhaps since the 7200 was developed and introduced some 2 years after Sherwood's appearance at Dayton 2007, the ICOM engineers took his comments to heart and engineered around those issues.

5 years is a long time in the development cycle of DSP technology these days, so it's a bit risky to reject IF DSP based rigs on such outdated research.

Based on my experience with my 7200 and my 706MKII, the AF DSP in the 706 MKII is a pale comparison to the IF DSP in the 7200.

Mark,

Thanks for the detailed reply. I think that perhaps one major difference between your experience and mine with the 706 is that when it was my primary rig, I was not located in a metro area. Although Albuquerque is not exactly New York City, it's definitely a lot more "RF intense" than my QTH in the mountains of Southwest North Carolina.

That being said, I'm more than happy these days to rely upon my IC-7200 as my main HF rig, rather than the 706.

Yes, I know what intermod sounds like. Luckily, I haven't run into it
yet. I also use mine as a second rig, tuning around one band when I'm
on another, etc. Fortunately, I don't live "in the city" and have a lot
of close neighbors. But I do have hams within 5-6 miles of me.

> "Decent" is an antenna at least as good as a dipole or a full length vertical.

I have numerous wire antennas, as well as the Hy-Gain Hy-Tower and the
TH-7DX at just under 60 feet. I consider these at least as good as a
dipole, and they receive lots of strong signals.

> 6M is worse. When there was an active TV channel 2 in ABQ the receiver was
> unusable.

While I've only been on 6 a few months, I have not run into any problems
with intermod or strong signal overload on strong band openings. There
are no channel 2 high power stations in the area.

I operate some SSB, some digital, and mostly CW on HF bands. I operate
SSB and CW on 6/2/70cm.

> As a "swiss army knife" radio it's tough to beat

> To me, coupled with the small screen and layered menus keeps this rig in the
> category of secondary/specific use category and not as a primary rig.

I would have to agree with both statements. Too small to be your main
radio if you're a serious ham, and the menu system makes a poor excuse
for having real buttons to push. The 7000 has come a long way toward
getting rid of the button issue. I used one for a week and was very
impressed with all of the improvements. More buttons without more size,
and a better, more readable screen. Still, most hams want a nice big
piece of hardware to use as their main radio.

For what it is, there's a lot packed into the 706. While I haven't been
mobile in a few years, I sure wouldn't be afraid to put it in any of my
vehicles, although, some RF testing re ECC box interference should be
done on any mobile these days. :o)

I agree with John on this one. I've got an original 706, a MK2 and a 703.

I really love the original 706, but after a lot of years, many spent in an off road jeep, the display is starting to delaminate a little bit. That's when I picked up the Mk2 (not G) and it's just as competent, but it is a bit "gainier" as some have mentioned.

I think the best thing about the 706 for me is it has been rugged and trouble free. When my son zigged when he should of zagged off road, and his forehead hit the radio and sheared a couple of pots off, the parts were easily available and replaced, and the radio's still ticking well. It's seen manpack service with a 7 AH battery, working half way around the world from the beach lots of times at 20 to 50 watts, been to lots of beach ops and has been relatively unaffected by sand and humidity, and the receiver is very good in the absence of loud signals - when you're in an electrically quiet location like the right spots in the Caribbean it's easy to work S zero cw signals all night.

The radio I've spent a lot of time comparing it to is my 897, which sees the same kind of portable/vacation/mobile service, but I find the 706 easier to operate with better audio and less fuss. If only Icom made a cool add-on battery system like the internal one 897 has.....(but the 706 in a World Pack with the 7 or 9 AH gel cell is pretty close in manpack operability, better even with the head remoted.

I shopped around and got the Mk2 last year for $375 (but had to buy a cw filter) and to me, that's great value.

Good luck, Scott

In a message dated 5/12/2012 4:58:54 P.M. Central Daylight Time, af5cc@... writes:

Dave,

I have had several IF-DSP based rigs, including a 7000, and the noise reduction in them still isn't anything to write home about-really doesn't do much. Even though it is as the IF level, and inside the AGC loop, I have never seen it actually lower the S meter reading on noise, as it should. Also, the DSP based filters in the 7000, which they do allow for more flexibility in setting the bandwidth, don't appear to work as good as the crystal filters do in the 706 series.

Go read the article about IF-DSP rigs at

www.sherweng.com

Rob Sherwood is considered the guru of receiver testing performance, and he sold his 7000 to get a MKIIG back instead.

Subject: [ic706] Re: Would like to own one

Welcome, Tom! I started out with an IC-735 myself and now have had my IC-706MkIIg for over 10 years. I am planning to get an IC-7000 maybe later this year.

The IC-735 was a very basic radio. It only had 10 memory channels, and only had bands 160m-10m. The 706, besides being more compact, has many more memory channels and also includes 6m, 2m and 70cm, all modes. It has an audio DSP which isn't all that good; I supplement it with an Amcom DSP speaker which greatly improves things (it's now sold by West Mountain Radio as the "ClearSPKR ClearSpeech"). I also got the narrow SSB filter for mine. The automatic notch filter works very nicely, though.

The 706 came in several models. I think the first one didn't have 70cm and later ones added that band and later, more power on VHF. Although this line is now discontinued you will still see many for sale.

The reason I am looking at the IC-7000 is the IF-based DSP, which is supposed to be really good, two manual notch filters, and DSP-based fully customizable filters; also a voice and CW keyer and lots of other improvements. But I do not plan to sell my 706, I think I'll keep it so that I can work analog satellites with it or just to have two HF radios around.

I have owned a MKIIG for about 10 years.  Used it mobile and now in the shack as backup and 6M rig.  Just used it last Saturday for a CW QSO with Japan on 17M.  Never had a big problem with intermod on strong signals if you use the attenuator and preamp properly.  I acquired narrow CW and SSB filters on Ebay, the narrow filters improve the radio tremendously.  The main downsides of the radio to be aware of from my perspective are as follows:

-DSP is poor and unsophisticated, even for audio DSP.  No bandpass filters implemented. Only noise reduction and notch.  Noise reduction works to reduce storm type static on CW but seems to only attenuate noise and signal equally on voice modes.  I seldom bother using the DSP.

-Noise blanker is also poor.  No level  adjustment.  Not nearly as good as noise blanker in my 27 year old Kenwood 830.  Won't work on most power line corona type noise that my other radios easily eliminate,  It does work on slow pulse type ignition noise.

-No CW memory keyer.  The basic keyer built into the radio works fine though.

-You have to go into the menu's to make most adjustments.  Makes quick adjustment of power, CW keying speed, AGC, split mode etc. kind of awkward for shack use.  Sometimes when in a hurry the adjustment you need is hard to find.  I have accidentally changed the frequency and lost my QSO when trying to adjust the internal CW keyer speed.

-Tends to run hot after extensive use.  I implemented mod to keep fan running all the time, this helped but still can get quite warm especially in modes like RTTY or PSK.

-You cannot easily switch in narrow filter when running in SSB mode, which you would like to do for PSK and RTTY.  You can do it but have to reprogram radio to think CW filter is SSB filter, then you cannot operate SSB until you reprogram it back the other way.

These issues do not keep me from enjoying the radio. Just be aware of them, the radio can sometimes be found for good prices on used market and gives you not only HF but all-mode VHF and UHF as well.  A lot of bang for the buck, I would not part with mine.  I would recommend sticking with MKIIG model and  later serial numbers if possible since I think price is not that much different.

I heard that sometime in the past there was a booth at Dayton where the guy would do radio mod's for you ...

Does anyone know any specifics? I'm thinking of bringing my IC706MKII to get the "MARS mod" (open for TX all freqs ... specifically interested in 60M)

thanks,

Yikes.. If they mod
anything at all have them change the electrolytic caps from 1000uf 16 Volts to
25 or 35 volts - C188/C164 (Rubycon 105c) Also have them fix the rotted trace
on the underside of the PLL board - it will go bad. (Under Both square hard
rubber supports). Fan mod probably good idea too. 73RickAC0TT

I'm sure that tech eventually got "dinged" by the FCC if he was doing "MARS" mods on radio for owner who weren't licensed by MARS!

Most reputable shops will not perform a MARS mod unless the owner holds a valid MARS callsign. I recently joined Army MARS in NC, and Matt Adrian at SAR Technical Services, an independent ICOM-authorized service center in MI (a fantastic shop, by the way) required proof of my MARS callsign/membership in order to perform the MARS mod on my IC-7200.

It's on its way to him this week.

Date: 2012-05-15 14:47:22 UTC
From: Steve
Topic: 19690  Message: 19690

After some research here on this list some posts dating back to 2009 indicate that the main tunning knob simply pulls straight off on the MKIIG. My knob is dragging and my research indicates that pulling the knob forward, or removing and cleaning would cure the problem. My question then is has anything changed from 2009 and now?

Forgive my ignorance and thank you in advance!

Hello, everyone,
Perhaps someone can help with this problem.

My 706MK2G suddenly stopped putting out RF on Sunday.

The power output still indicated as normal.
The SWR still showed Good (2 blobs as usual
The ALC reading (I am using FM) was hard over instead of the usual threequarter scale.
I have checked for dry joints around the antenna socket to PCB.
Is there an antenna change over relay that could be sticking?

Any suggestions welcome.

I have a new (2010 or 2011, one of the last in stock) MKIIg and just pulled the knob and it slid off. I kind of pinch it with thumb and forefinger and lever it off with my fingers against the face plate.

Same thing on my MKII, not sure of the original or 703, never had those.

Speaking of which, is the 703 still in production? I like the 70x series, but don't need 100W.

It seems unlikely it would show full power out and normal SWR with any kind of antenna relay/connector fault. I would check it into a dummy load and external power meter to rule out any coax/antenna problem first.

I'm sure your on a simplex frequency with no tones enabled when listening with handheld?

Check the antenna with a external swr meter.
Based on my experience which may vary, you should hear something if it's the final. I could operate echolink if I was 1/4 mi from repeater even though it didn't wiggle a 4w scale meter.

Good luck
Mike R

Don’t the radio have two (2) antenna connectors.

One for HF, the other for VHF UHF.

GO DAWGs

Subject: Re: [ic706] MK2G No TX output

I'm sure your on a simplex frequency with no tones enabled when listening with handheld?

Check the antenna with a external swr meter.
Based on my experience which may vary, you should hear something if it's the final. I could operate echolink if I was 1/4 mi from repeater even though it didn't wiggle a 4w scale meter.

Good luck
Mike R

PS there's also a yahoo group for mk2g

Topic: 19703  Message: 19703

I have an Icom 706 and I am looking for an interface that will allow NA contesting software to work as a memory keyer during contests. I remember doing this years ago with a serial port and a Kenwood TS-2000. Is there a simple cable that goes between a USB port and the rig to allow the computer and software to function as a keyer?

# 19704. 17m and preamp question

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-22 18:54:17 UTC
From: John G.
Topic: 19704  Message: 19704

I am trying to determine if what I am hearing is typical atmospheric noise, of if I have a line noise problem of sorts. Here is my situation:

I have an Icom 706 original model. I find that all three models of theh 706 are too sensitive on 20m and below with the preamp on-you get to listen to a S8 noise or so most of the time. So I leave the preamp off on those bands, and on 30m and below it seems just right on the original model-you see an S1 or so noise level on those bands. On 20m it is probably a little deaf with the preamp off, but works fine. On 15m and above I turn on the preamp and it seems just right.

So what is people's experience on 17m? With the preamp on I see around a S7 or so noise level. WIth it off, it seems to lack a little sensitivity on that band. I did work V85SS on 17m yesterday so I can hear stuff with the noise that my rig is getting, but it is also tiring ot listen to, especially if it is something that can be fixed. So, with your 706 (any model) on 17m, what sort of background noise level are you seeing with the preamp on?

# 19705. 7062G won't power up!

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-22 20:32:52 UTC
From: ei3gsb
Topic: 19705  Message: 19705

My Mk2G won't power up after I plugged in a G4ZLP digimode interface cable in the back of the rig. The radio was powered up at the time and the interface was connected to the PC. Anyone have a rough idea as to what I may have damaged? I've done the obvious checks of blown fuses but can't see any obvious problem. Any clues??

Cheers,
Andrew

Andrew,

Check out the Molex power connector. You may have moved it around putting the G4ZLP in and caused the connectors to open up and lose contact. 706's are notorious for loose connectors in the Molex plug.

From: Ralph Mowery
Topic: 19704  Message: 19707

You are picking up way too much noise from somewhere.  If there are no thunder storms near you, the noise on most of the bands with the preamp on should be very low.  Less than an s-3.  I have the MK2G and 20 meters and above there is almost no s-meter signal showing most of the time with no signals tuned in. Also have the Icom 746 pro with the preamp on and almsot no s-meter signal showing now.  This is with either an off center fed antenna about 130 feet long up 50 feet or a beam up 60 feet.  Down on 80 and 40 I seldom use the preamp.
During the summer there is often storms that produce lots of noise on those two bands,especially 80.

With the ammount of noise you have, which seems to be all the time, I would look for a local noise source.  It could even be power line noise being generated several miles away.

YOu do not have to have a good mobile antenna, just some wire or a 2 meter antenna. I would put the 706 in the car and ride around to see if the noise is near your house or somewhere close by.  If your car is generating much noise, you may have to ride down the road a way and stop and cut off the motor..Usually the line noise gets weaker as you go up in frequency, so if it is strong, go to a higher band as you get closer.

In my experience, power line noise can be found by opening a QSO with
AI4YC... typically, when I'm mobile, and working a DX that I thought
I'd never make.

# 19713. Re: [ic706] 17m and preamp question

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-23 14:37:18 UTC
From: John G.
Topic: 19704  Message: 19713

Hi Ralph,

I think some of the difference might be in S meter calabrations.
According to the QST reviews, the strength of a signal (in millivolts) needed for a S9 signal, with the preamp on, is:

Icom 706 original 3.75
Icom 706MKII 21.1
Icom 706MKIIG 11.2
Icom 746PRO 27.5

As you can see, there is a pretty big difference. A S9 signal on the 706 original doesn't take much. It would take 7 times as much RF energy to generate a S9 signal on the 746PRO, and 3 times as much RF to generate a S9 signal on the MKIIG. I am sure that might be part of the reason we are seeing something different in terms of S meter readings.

If you can pick up the interference on 2M, that implies it's either very strong, or very close. I've never been lucky enough to start off on VHF to pick up any EMI/RFI sources.

Start with the frequency you're hearing the interference on. In this case, 17M will not be the easiest to direction find but it can be done even if all you do is drive/walk around with an omni antenna and make notes of S-meter readings as you go. Also make notes of how high you can go in frequency and still hear the noise. With many sources of noise there is a lot of harmonic content and those levels drop off precipitously in strength the higher in frequency you go. It's a pretty good indicator that the place where you can pick up the interference at higher frequencies is closer to the source.

First things first - make sure it's not at your own location. Put the rig on a battery and shut off all the breakers to your house. Light dimmers, cell phone chargers and a myriad of other devices can generate lots of grunge and your own house must be ruled out before you go on a wild goose chase around the neighborhood or blaming the power company.

You can use any frequency where no one is talking. The frequency is often not critical.

Also it is often beter to use the AM mode when tracing down noise.

YOu can ride up and down the road and see if the noise gets stronger or weaker.  As the noise gets stronger on one band, you can often switch to a higher band and the noise will go down.  Then as you get closer , the noise will get stronger on that band.

Larry, this probally is litlle benefit but when I ran 2n ssb on 144.200 power line noise could be horrendous on the wrong road/highway. Florescent lights too.

Some have talked about using portable radios with aircraft band with success.

I've done some "sweeping" in my own QTH and did find one of those "touch" lamps to be a big noise generator. Apparently, some (or all) of the "touch/on," "touch/off" lamps have an oscillating device that makes them work that generates a lot of RFI.

Also, I have a wireless router (NETGEAR) that generates 2-meter RFI. I've read that Linksys wireless routers are the worst offenders.

When you get in close, the air band handheld will work well. Decrease the antenna the closer you get to refine the resolution. Take a small sledge hammer to hit the pole when you get to a suspicious one. Give it a good knock and see if the noise varies. You can also shake a guy wire if it has one. This often finds loose hardware up above.

But... be careful. Just because you find a peak in one area and quiet either side doesn't mean the problem is there. It can be miles away and just have lobes. Noise hunting can be very hard work and cover miles, or it can be right next door.

Yes, the old S-meter problem.  I hate it when people start mentioning s-meter readings.

I do agree with you that the differance in the s-meter readings could be because of that. However, by ear, there should be very little noise comming out of the speaker compaired to the desired signals when the volume is adjusted for normal while a good signal is on.  That is on the bands above 10 mhz  and much of the time.  If the noise is there most of the time, it is probably something local and not the atmosphere..  Sometimes during the summer, there have been times that there is lots of noise on most of the bands.

You did type in milivolts and I would think that you really ment to put in microvolts.

I have a signal generator that  I can check out the s-meters with, but I don't think I have ever done it more than once or twice on the rigs I have.  I do use it for such things as the SINAD and to compair receivers in other ways.

Hi Ralph,

I think some of the difference might be in S meter calabrations.
According to the QST reviews, the strength of a signal (in millivolts) needed for a S9 signal, with the preamp on, is:

| | |
|---|---|
| Icom 706 original | 3.75 |
| Icom 706MKII | 21.1 |
| Icom 706MKIIG | 11.2 |
| Icom 746PRO | 27.5 |

As you can see, there is a pretty big difference.  A S9 signal on the 706 original doesn't take much.  It would take 7 times as much RF energy to generate a S9 signal on the 746PRO, and 3 times as much RF to generate a S9 signal on the MKIIG.  I am sure that might be part of the reason we are seeing something different in terms of S meter readings.

I had to get rid of a Linksystem router because it put a birdy right on the same frequency as the local repeatrer that  I do most of the work on.

I am always hearing horror stories about many things causing problems that do not even have any radio gear in it.  One was a battery charger for a drill.  I do not have one, but have heard the touch lamps often generate noise.

I do not have one mainly because it has been reported the Plasma TVs generate  a lot of noise.   I went to a LED type large screen for that reason.

The transformers do not usually make the noise, it is often the loose connections on the power lines.  The substations where lots of transformers are do seem to have a good potential for having the loose connections.

Ham friend had lots of noise and he found it at a substation several miles from his house. Took him about a month or two to find it and get the power company to do anything about it.

If you check the reported FCC enforcement cases accessible through the ARRL web site [1], it seems that power companies are the recipient of many of the "enforcement letters" from FCC Enforcement Counsel Laura Smith. Some apparently ignore complaints until threatened with fines by the FCC.

Electricity and every piece of hardware in the system. All a transformer does is change the voltage.

: What frequency on 2 meters do you suggest to best detect power line noise?

Power line noise won't be isolated to a frequency. Anything within range of the receiver in AM will be fine. I use HF with a 24" antenna and attenuator and can track noise to within a few inches of a pole. I then use a hand-held device to identify the specific piece of hardware or bolt on the pole. I've been chasing RFI for years and the 706 is my primary piece of equipment. In one case I tracked a 4W signal in a building forty-five miles away on a 10" antenna across three valleys, and two mountain ranges.

I had a similar problem, though I was using a IC-718 at the time.  I had horrible noise on all bands, but I noticed that almost as soon as I was out of the driveway, it would clear up on my 2m mobile.  That lead me to believe it was pretty close.  I took my 2m meter ht into the back yard and held it close to my body.  When my back was to the utility pole the noise would drop significantly. I suspected it was the pole in my backyard.  It took 2 weeks to get someone from the utility company out to diagnose the problem.  It turned out to be a lightening arrestor that had taken a hit but not failed.  It was arcing.  Since there was no power outage associated with the problem, it was given a low priority for repair and took another 6 weeks to get fixed but once it was fixed everything worked great.

Aircraft band radios are AM. Any battery powered AM radio works well to
pick up line noise. Try an AM band radio tuned between stations.

Topic: 19708  Message: 19729

Found power line breakers were noisy. They need to be cycled to remove
salt (Florida) and corrosion.

From: Deacon Dave
Topic: 19708  Message: 19731

In the 'olden days' I used my mobile station, Gonset twins, tuned to 10 meters. I would slowly drive up and down the neighborhood and my 'old timer' ham friend Warren,W1MCX-SK, would whack, I mean really whack, the power poles with a baseball bat. The offending pole would exhibit a change in noise characteristics.

I raised some eyebrows! But we would easily isolate the noise sources.

That works at congested radio sites too. A sledge could damage a tower but a bat just "rings" them. Watching a spectrum analyzer you can see a marked change in the noise floor when you "ring" the offending tower.

# 19733. Fw: PL Tone "Hum"/Over-Deviation on IC-706MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-24 15:39:18 UTC
From: Larry J. Ford
Topic: 19733  Message: 19733

On a 2-meter net the other night, some of the other stations noticed a "hum" on transmit on my 706MKII that I was using. The most technically-savvy member of our local club looked at my transmitted signal on some of his equipment and opined that it was the PL tone generator (oscillator?) "over-deviating" (or some such).

I sent him the service manual for the IC-706MKII, and here's what he replied (see his message below). Anyone have any suggestions on adjusting the PL tone deviation level, short of sending the rig back to an ICOM shop? If I do need to send it in, I'll send it to Matt Adrian at SAR Technical Services in Michigan.

Thanks.

I've gone over the schematic of your rig and find no way to adjust the tone deviation level. While I would prefer to check your unit on the bench, I can measure the deviation level on the air. Give me a LL sometime if you want to run an on the air test.

Larry, I would try a different power supply or battery/vehicle first.

If the power supply is not sufficient, it will have hum on the output.
My power supply builder showed me this on a scope. Of course you could try reducing power as well.

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-24 16:25:50 UTC
From: Larry J. Ford
Topic: 19733  Message: 19735

I was using an AC power supply, an ICOM IC-PS740 switching power supply. Last time I put a VOM on it, it was rock-solid at 13.8 VDC output.

At a little less than 20 watts out on 2-meters, the current draw should not have been a problem, and the PS740 is rated for 20A.

Don't ask me how I know what an under-voltage condition will do to audio!

Thanks.

I would suggest you first have your friend go to simplex and listen to your rig. Turn the PL tone off and see if it goes away. Change your PL frequency and see if the tone changes. Your friend should be able to tell a 60 Hz Hum from a PL tone.

73,
NJ2L

Yes, checked that one also as well as the fuse in line in the DC lead.
Just got it back today after a friend looked it over. I reckon it's gonna have to go to the UK for repairs now...

Hi Andrew,

Maybe worth checking the regulator in the front panel. Death of that one will cause it to not power up. ALso check regs on the PLL board as well.

Cheers,

Simon.

# 19740. Original 706 2m FM problem

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-26 21:05:59 UTC
From: jkametz@sbcglobal.net
Topic: 19740  Message: 19740

I'm new to the forum and bought a used original 706 from an online swap site. I figured out how to set repeater splits but when I key the mike I hear some kind of random static-like noise over the carrier. I'm puzzled because when I key the mike on simplex --or send digital messages by simplex -- all is quiet (no static). Any idea what's going on, and how to get it fixed?

Thanks in advance for your help.

You don't say whether you're listen via the repeater or directly to your transmision. If you only hear them when working through the repeater I assume they are being picked up locally at the repeater site. Is it man made interference or just weak signal at the input?

I am hearing the static-like, continuous sound while monitoring the return signal from the repeater on another 2 meter rig in my shack. I guess another way to describe it is a hash-like sound. Also, I am using a 2-meter brick to boost the signal, although I can usually hit the repeater from my home with an HT. As I said before, I have no problem with noise on simplex.

Topic: 19740  Message: 19743

There is no real problem. YOur transmitted signal is probably fine.

What is going on is when you are on simplex the monitoring receiver is picking up the signal from your transmitter direct. When you go through the repeater, the monitor receiver is picking up the repeater,but it is also being overloaded by your transmitter. Sort of like trying to pick up two signals at once. The closer you are and the stronger your signal is, the worse it is. If you move the receiver about 500 feet or more away, it would sound fine.

This "problem" is often called front end overload. The monitor receiver just can not separate the two signals when the off frequency one is very strong.

When this happens at a repeater because the repeater does not have enough selectivity, it is often called ''desense'.

I am hearing the static-like, continuous sound while monitoring the return signal from the repeater on another 2 meter rig in my shack. I guess another way to describe it is a hash-like sound. Also, I am using a 2-meter brick to boost the signal, although I can usually hit the repeater from my home with an HT. As I said before, I have no problem with noise on simplex.

You are also likely desensing your 2nd radio by transmitting near it on a near by frequency. There will be no densense if you listen on the input frequency.

Thanks for your discerning evaluation Ralph,

I never thought about anything like that. To verify, I'll shut off the shack receiver and then get some radio checks/signal reports from remote stations -- but your explanation makes a lot of sense.

Thank you!

Listen on your 2nd radio to the input frequency of the repeater, not the output. If there is no noise, then the problem is your signal level into the repeaters. You may have an antenna issue that is causing you to transmit a weak signal. Check it with a VHF-UHF SWR bridge or power meter.

Hi Ralph,

Thought you'd like to know I left the other 2 meter rig off, and had a QSO with someone I heard on the repeater. She gave me a good signal report, saying everything sounded great. Thanks again.

Thanks for letting us know.  As I thought there is no problem with your transmitter, just overloading the receiver because it is so close.

Has anyone used an "original" IC-706 with a JPS NIR-12 (external AF DSP)?

If so, I'd be interested in hearing how well the combination worked (or didn't).

73,

I've used a mk2 with the mfj unit.

I got it used. It helps some on ssb. Guys say they really work well on cw. I used to have interference from a net 2.5kc away. It helped to at least make out my group but I eventually upgraded rigs which I wanted a bigger desktop rig anyway.
I decided on a down conversion receiver.
I'm not familiar with that particular model Larry.

Mike,

The JPS NIR-12 was a mid to late '90s stand-alone AF DSP unit, fairly-well regarded from what I have read. http://www.eham.net/reviews/review/62746 JPS was acquired by Raytheon, and got out of the ham business.

I bought it brand-new, in-the-box, never used, at a ham club auction in 2000 for $50.00. It's been in my closet ever since. Some folks will pay a good price for this unit, and I've seen sales in the $100 - $200 range.
( e.g., http://www.eham.net/classifieds/detail/375119 ) Apparently, it's a good way to add some AF DSP capability to older rigs that didn't have it and can't accept an internal AF DSP module (e.g., the original IC-706).

My original 706 is now going to become my "back-up" HF unit (behind my IC-7200), and since I call the NC ARES HF net weekly on 75 meters, I thought it might be useful to get it up and running. Especially since my 7200 just went to ICOM Service Center - Michigan (Matt Adrian) for a MARS mod.

# 19752. Using 2 706s for crossband repeat

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-30 20:25:56 UTC
From: John G.
Topic: 19752  Message: 19752

I am looking for a way to get crossband repeat from HF/6m to 2m/70cm, and can't afford a TS2000 right now. I am wondering if this idea would work. If I had 2 Icom 706s, I am thinking of interfacing them for crossband repeat using the mic jack on each one. The receive audio is available at the mic jack, so if I hooked up the mic audio out on one to the mic audio in on the other and put the rigs on VOX, and squelched the audio on each, would it work like crossband repeat. As the receive squelched opened on the one rig, it should take the other 706 transmit via VOX.

Would the interface cable between the 2 mic jacks be this easy? Just take the receive audio from one and wire it to the mic audio on the other, and vice versa. Anyone try this yet?

The FT-8900 won't work for the original poster if he wants to cross-band repeat to or from an HF frequency OTHER than the FM segment of 10 meters which is all the FT-8900 covers in the 10 meter band. It's an FM-only rig.

Of course, the original poster didn't state exactly what he wanted to do.

I have used a FT8900 and it does work great on crossband repeat. However, it is limited to FM and 6m/10m on the long distance band side of things. I was hoping to get on 6m SSB, or maybe 20m or 15m SSB as well and do some real DXing!

# 19756. Distorted transmit audio on SSB ( HF )

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-31 08:39:42 UTC
From: ON4BBQ
Topic: 19756  Message: 19756

dear all,

was looking into the messages on this forum but no joy.

My IC-706 Mk2G ( first owner, +10 years old ) has developped distorted audio in transmit on both SSB in HF.

Voltage supply is indicating 13.8 V.

Any ideas what can be the culprit ?

Many thanks and 73

Ronald, ON4BBQ ( LX3RB , N2YCQ )

# 19757. Strange power out problem

Yahoo group: ic706 (2010 — 2015)
Date: 2012-05-31 08:08:39 UTC
From: on1cfx
Topic: 19757  Message: 19757

Now here is a question for the 706 expert (mkII). This one came in very sick put now is almost fixed. A strange thing happens with the output power. If I start transmitting low power, and then while continuing to transmit, slowly ramp up the power out setting (like 1 step a second, slowly rotating the dial), power goes up to full output, and I can keep it there indefinitely (so all seems ok now with drivers and finals). This works about 1 out 5 times. Other times, or when you start at H setting, power never goes above 10W.

All alignments react as they should, APC is good, so something must be providing power foldback at some point?

I am really puzzled by this one.
Thanks for any advice,

Xtof 73 on4iy.

Almost sounds like high VSWR is causing the protection to kick in. Does
it do it on a proper dummy load too?

this is on perfect dummy load, and VSWR remains 1:1

as far as I can tell now, the ALC is doing its job, but the CPU D/A
never nevers seems to
provide a high enough ALC ref voltage/

very odd

X

The 706 ALC has a short but finite transient at start up. It calls for full power for several 10's of milliseconds then turns power down.

Possible: you have a defective component in the ALC Loop??

Subject: [ic706] Distorted transmit audio on SSB ( HF )

dear all,

was looking into the messages on this forum but no joy.

My IC-706 Mk2G ( first owner, +10 years old ) has developped distorted audio in transmit on both SSB in HF.

Voltage supply is indicating 13.8 V.

Any ideas what can be the culprit ?

Many thanks and 73

Ronald, ON4BBQ ( LX3RB , N2YCQ )

Yes it is definitely ALC related, since full output can easily be achieved by bypassing the ALC... It is like the processor and analog digital converter sometimes output the correct ALC ref voltage, and then a bit later it is gone.

I have also noticed the power coming back up to full strength only to go away after a few seconds, if you keep the rig keyed for a few minutes.

All analog circuits seem good.

Xtof.

I replaced the POC output from the CPU/ DA converter with
an external source and the ALC works perfect, up to and
including full Pout.
So I can only conclude it is the DA or processor going
haywire.

# 19767. Readable parts layout for 706-MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-06-03 17:23:25 UTC
From: tj
Topic: 19767  Message: 19767

I am having a problem with my MKII with 2 meter power output. sometimes it actually puts out 20 watts, but mostly it is down around 6 watts. I am trying to trace down the problem and I have a downloaded service manual. According to it the the measured FORV is compared to POC, i.e. power setting at IC7 and it's output determines power out. I.E. it makes FORV to the same level as POC.

Problem in my downloaded service manual the parts layout pages are pretty useless, basically unreadable. So, I cannot locate IC7.

Does somebody have a MKII service manual where the parts layouts are readable?

Jeff

I can't tell you how many hours i've spent picking my way thru those boards mapping out components and pc traces to troubleshoot a problem. Most of the time the fix is faster than mapping the board. Would have loved to get my hands on a better parts layout for those boards.

I have the service manual on paper so can scan any resolution required.
Although with the gray/pink it is not even easy to see on paper.

# 19774. DSP Solution for "original" 706 (was: FS: NIB UT-106 DSP unit)

Yahoo group: ic706 (2010 — 2015)
Date: 2012-06-04 14:05:55 UTC
From: Larry J. Ford
Topic: 19774  Message: 19774

Tim,

I had the same problem, an "original" 706 which would not accept the ICOM UT-106 AF DSP unit. Trying to use it as a back-up HF rig was somewhat "frustrating" after being used to the AF DSP in my IC-706MKII and the IF DSP in my IC-7200.

My solution (one of the few available for the original 706) was to match the 706 to a JPS NIR-12, a stand-alone AF DSP unit. You feed the audio output of the rig into the NIR-12 and plug headphones or a speaker into the DSP unit.

http://www.eham.net/reviews/detail/232%3Fehamsid%3D05000876493544318efc6524a00d3088

Fortunately, I had sitting in the closet that I bought one at a ham club auction several years ago. After setting it up and beginning to "play" with it over the weekend, I've concluded that it is at least as effective as the UT-106 in my 706MKII, and may be more effective once I learn all the settings and tweaks.

From time-to-time, you see one of these (or its predecessor the NIR-10) up for sale on the ham swap forums or at hamfests, so that might be one solution if you intend to stick with the original IC-706.

I think there's a couple of other alternatives out there, such as an AF DSP speaker ("Clear Speech" or some such), but I don't know anything about those.

HTH.

Hi Mark,

I think your mk2g came with the dsp but someone may have pulled it out and sold it. How dare them!
Personally, the dsp is not very good except I believe it provides a notch filter for cw. For ssb I'll give it $50 in actual value.

Early on I bought the wide ssb filter but never really used it. Use the narrow filter all the time.
I may even have a wide ssb filter I bought for a second rig.

I've got a mk2g and a mk2.

If your new to the 706, some of them have discontinued finals so keep swr 1.7 or below. On fm probally lower than that.
The swr meter only works on hf, gives a false 1.1 reading on 2m/70cm.

I do not think either of the ssb filters are worth the cost.  The CW filters are ok.
I have the 1.8 kc filter in a 706llG, but only payed about $ 60 for a used one at a hamfest.  Hardly ever use it.  If I were to get one it would be narrow instead of wide.

One reason I bought  the 746pro later on was the filters are digital and nothing extra to buy.  I do still have the 706.  Seems that lots of companies want a high price for the 'extras'.  Years ago a dealer told me he would like to just sell the extras and not rigs.

# 19780. Which desktop condensor?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-06-06 14:25:47 UTC
From: g1zhd
Topic: 19780  Message: 19780

Hi All

I've been spending many an hour pondering over getting a desktop condensor microphone and EQ/Mixer/Pramp unit and I still feel I am none the wiser. Just as I was getting close to spending the money on the Heil PR-781 I noticed in the smallprint it stated 'not suitable for 706'.

What is everyone's experiences so far. I can see that I can buy a 1 inch condensor microphone for as little as 50GBP and a mixer for about the same, but what aren't you getting, as opposed to 400GBP microphone and 500GBP preamp and eq units.

Why is there such a big difference and where do you get the most bang per buck? I just want to be a little more punchy than the standard hand microphone. I do have a Heil Pro Set Elite on order, which is taking weeks to get, but something tells me it's not going to be as punchy as I would like and would get with a desk microphone and eq.

Thanks
Adam

Just a thought... all my research indicates that the Icom HM-103 that is
the standard mic with the 706 series is a Bob Heil-designed mic, and pretty
tough to beat for performance.

Of course-- that doesn't give you the hands-free option of a desk mic...

I use the "improved" Heil Traveler headset/mic with my 706s, and have had good audio reports, as well as with the HM-103.

The Heil Traveler has the Heil iC mic element.
http://www.universal-radio.com/catalog/mics/3082.html

Of course, it's not a desktop mic, but I actually prefer a headset, and I believe the Heil iC element can be found in certain desktop mic models.

Subject: [ic706] Which desktop condensor?

Hi All

I've been spending many an hour pondering over getting a desktop condensor microphone and EQ/Mixer/Pramp unit and I still feel I am none the wiser. Just as I was getting close to spending the money on the Heil PR-781 I noticed in the smallprint it stated 'not suitable for 706'.

What is everyone's experiences so far. I can see that I can buy a 1 inch condensor microphone for as little as 50GBP and a mixer for about the same, but what aren't you getting, as opposed to 400GBP microphone and 500GBP preamp and eq units.

Why is there such a big difference and where do you get the most bang per buck? I just want to be a little more punchy than the standard hand microphone. I do have a Heil Pro Set Elite on order, which is taking weeks to get, but something tells me it's not going to be as punchy as I would like and would get with a desk microphone and eq.

Thanks
Adam

Adam,

I hate to sound too "old farty", since I am only 53, but the 706 does not need a fancy system. If you set the audio right all you need is a nice and easy to use mike like an Icom SM-20. Save your money.
I have owned all 3 models of IC-706 and never needed such enhancements to the audio department.

Remember one thing: If you push the envelope too much it may just break.

More for Adam and his desire for "punchiness"..

Adam said "I can see that I can buy a 1 inch condensor microphone for as little as 50GBP and a mixer for about the same, but what aren't you getting, as opposed to 400GBP microphone and 500GBP preamp and eq units.

Hi Adam...
I give you my sincere word that if you put all  that money into antennas you would never again think that puchiness mattered.,

Another thing to consider is longevity...Do you want your radio to last a long time or not? Thinking on an automobile line may help express this idea...Do you want a car that will get you where you need to be without making you pay big time for the trip or not? This is a very good way to consider how you want your radio to work. Squeezing the last KM out of the car may be fun, but it is also expensive.

My suggestion is simple and easy...leave the rig as it is with an SM 20 or whatever. Use that money to build antennas. You will also learn a hell of a lot more.

I agree with the ones that say not to spend a bunch on the microphone system.  Ham radios are made for communications and not broadcast quality audio.  Some rigs let you change the filters so the transmitt audio is a lot wider than is needed for good speach. Causes qrm for other stations.  Then if the station on the receiving end does not have the wide filtering, the transmitter sounds bad.

On a 706llg I have I am using an old second hand desk mic (Shure 526T) and get good reports, also use the same type mic on the 746pro and get very good audio comments.  I think I payed about $ 30 for each of them off ebay.  About 10 years ago I asked about the mics and that mic was recommended.

I am thinking the OP was looking into some $ 500 mic and equalizer system.  Before spending that much on the 706, I would think it is time to trade for a beter rig that has much  of the audio processing built in.  Not that it would do much good for the transmitter, but may help with a beter receiver.

Spend most of the money improving the antenna system or get an amplifier.

I am at the old fart stage as have been a ham for over 40 years and just retired.

All I ever used was the dtmf touch tone mic which has a better feel than the small toy like mike that comes standard.
I use a old heil traveller headset also.

I think there have been some complaints of the china hand mikes that have been for sale recently for
$15. I almost bought one at a hamfest and still might.

I use a Panasonic KX-TCA86 telephone hands free headset that I paid a dollar for at a garage sale and I have many comments on how good my audio is. Some think it is a Heil. I also built an interface adapter for my Kenwood TS-140S, Panasonic is electret and Kenwood is dynamic. Works great on it to. I also use a Sanyo headset, but others say it is "harsher" comparing it to the Heil "DX" element while comparing the Panasonic to a Heil "rag chew" element.

# 19792. 707 MKIIG shutting down when transmitting on 20m

Yahoo group: ic706 (2010 — 2015)
Date: 2012-06-10 03:47:18 UTC
From: vk5dc
Topic: 19792  Message: 19792

Hi all
Thought I would post this solution on the forum to a problem I was having in a mobile installation.
My set up consists of a 706MKIIg, remote head setup with the radio body at the rear of the car, Codan 9350 auto tune mounted on the rear tail gate (Toyota Prado).
The radio will tune and transmit on all bands except 20m where it shuts down (turns itself off) altogether if I transmit over 5w.
Searched the web and found a reference to ensuring the small screw that secures the remote cable to the radio body is used and is tight etc. I have had a similar install in 2 other cars and have never used the screw to secure the remote cable (mainly due to the fact that the 706 needs to be moved from the car to the shack regularly). I thought that it would surely be RF on the DC cable as the run is quite long but as soon as I found an appropriate screw for the remote cable, tuned the 9350, increased the power to 100w everything is working perfectly.

Hope this info can help someone else as well.

Regards
Dale

From: Locutus_of_texas
Topic: 19793  Message: 19793

I have only had this radio for a few months and have only had it set up twice so I can't say for sure if this is a new problem or if it has always been there but last night I was trying to test out a new tuner I got at HamCom and I noticed that there was no deflection on the meter no matter the tuner settings. So I hooked another SWR/power meter inline with the radio and antenna and there was no deflection of the needle on any HF band or power setting of the radio. On 2 meters I get full deflection of the meter. It would appear that I have very little power coming out of the radio on HF. I know there is some output because I made one contact but the report was that I was very weak. Any suggestions? I have some electronics experience but I am basically a noob with anything this complex.

I need to correct my earlier post.  All testing after initially finding the issue were done with a second and a third SWR/Power meter and a 50ohm dummy load so SWR was not an issue. Both SWR/Power meters were cycled thru their forward, reverse and power settings with absolutely no needle deflection on any power setting of the radio while on HF.

I do have normal receive on HF.  I don't seem to have any issues finding other stations even on a mediocre G5RV we had thrown up last night.  How would I check this transistor and what should the values be.  Also any idea where I would locate it inside the radio?

I have seen this problem a few times,
it is usually the digital transistor driving the relay
that switches the the driver output between
the finals for HF and 2m.

Check first if you have "normal" receive on HF.
If so, check the output of this transistor.
(It is very small!!!)

Michael,

You said on 2M you get full deflection. I am assuming you are using FM mode on that band which is constant carrier. What mode(s) are you using to test the HF section? You should try CW, AM, or FM, all of which produce a carrier. Unless you are whistling into the mic when using SSB you won't get any output that you can measure reliably on a SWR/power meter unless it is a peak reading type.

Some problems are mode-sensitive. It may work on CW but not on SSB, etc. If you can get a full power carrier out using CW that would tell you the basic transmitter and PA section is functioning properly.

If it works in CW you might check the mic. Maybe it is not plugged in solidly or there is a broken wire. You said you only used the rig twice so it is possible there is a problem with the mic or maybe you have accidentally set the mic gain to 0.

Keep the list posted on your progress.

Thanks for the tip. I am having the same problem in a Toyota 4Runner
(maybe something to do with the Toyota electrical system?) and was
trying to do some more testing. I'll see if I can find the screw or one
that will work. 20M mobile can be fun.

You are correct about using FM on 2m.  I will try out different modes tonight to see if there is any difference.  The main SWR/Meter I was using for the majority of testing has settings for average and peak.  On SSB I did not get any deflection even when speaking or whistling into Mic.  I will check mic gain settings.  I will also throw on the heil headset I have for it as well and see if there is any difference.

Michael,

You said on 2M you get full deflection. I am assuming you are using FM mode on that band which is constant carrier. What mode(s) are you using to test the HF section? You should try CW, AM, or FM, all of which produce a carrier. Unless you are whistling into the mic when using SSB you won't get any output that you can measure reliably on a SWR/power meter unless it is a peak reading type.

Some problems are mode-sensitive. It may work on CW but not on SSB, etc. If you can get a full power carrier out using CW that would tell you the basic transmitter and PA section is functioning properly.

If it works in CW you might check the mic. Maybe it is not plugged in solidly or there is a broken wire. You said you only used the rig twice so it is possible there is a problem with the mic or maybe you have accidentally set the mic gain to 0.

Keep the list posted on your progress.

Hi Ken,
See your still at it!! I am off the air lost my tower and all antennsa last Aug when a wind shear sent everything flying into my in ground pool. 80 feet worth of tower, 3 great beams. Got $250 for scrap alum. Did get insurance payoff, but now dont know what to get. Also got a new vehicle so no mobile yet.

Michael,

You said on 2M you get full deflection. I am assuming you are using FM mode on that band which is constant carrier. What mode(s) are you using to test the HF section? You should try CW, AM, or FM, all of which produce a carrier. Unless you are whistling into the mic when using SSB you won't get any output that you can measure reliably on a SWR/power meter unless it is a peak reading type.

Some problems are mode-sensitive. It may work on CW but not on SSB, etc. If you can get a full power carrier out using CW that would tell you the basic transmitter and PA section is functioning properly.

If it works in CW you might check the mic. Maybe it is not plugged in solidly or there is a broken wire. You said you only used the rig twice so it is possible there is a problem with the mic or maybe you have accidentally set the mic gain to 0.

Michael two things to check
1-when transmitting., are you reading at least 13v., not 10 or 11 volts.,
these radios notice low voltage

2-Again, when transmitting., how much current are you drawing??
3-You do know there is a control to adjust the tx power from 0 to 100 Watts
??
Just some suggestions

The RF power is set to H.  The voltage stays rock steady at 13.88v on my mulit-meter only changing by a few hundredths of a volt.  I have not measured current as my multi-meter can only measure a max of 10 amps and supposedly a properly operating 706 can pull 20 amps on transmit.  My PS is rated at 35 amps.

Hi
The 706 has had past common issues with a few things. One of them is the relays in the pa going bad, another is a bad swr sense diode. If it's the diode it's a cheap fix if you ca do it yourself. Relays aren't too much trouble either. Another step to take is to ohm out the driver and pa on the hf side.

Chris

Michael,

if you tx on HF ssb without modulation what is the power consumption?

This should be the RX power consumption + 2A more or less

one thing that often goes bad is the relay transistor for the HF/2m tx
relay following the driver stage.

If the HF PA is well, and rx is good, this is the place to look (either the
relay or the digital driver transistor).

Thanks to all who made comments and suggestions to my query. Hopefully I will be getting the Heil IC headset in the next couple of days and I think that is all I'm going to use on the 706. I've spoken to a few more people on air and has decided that modifying the input in to the 706 mark 1 may not be such a good idea. I will however be considering my next radio for home, as I wish to move the 706 in to the car.

Thanks again all.

All

My next question. From the day I bought the 706 mark 1, back in 2003, I have often wondered if I should have spent the extra money (when I could afford to) and bought the FL-223 filter for it. I'm struggling to find many suppliers but it still seems to be around $130 in the USA or £84 in the UK. Can anyone suggest a cheaper supplier and more importantly let me know how much difference it actually makes. Is it worth doing?

Thanks

Topic: 19812  Message: 19812

Well, sadly, my 706 (just 706, not a mkII) took a dive and the LCD is damaged. It's still usable and works, but it looks bad and bugs me.
I'm curious about a replacement. Do any of have experience with doing that? Is a replacement part even available? I'd rather not get the entire control head replaced, but I guess I might if it came down to that being the only way to do it.

Little help please? :-)

Thanks!

Hi Michael. What I mean is checking for opens and shorts as well as voltages present when operating in both tx and rx on the leads of each driver and pa transistor. The service manual should show you some desired volatages. This will give you input on if the transistors are bad. Likewise see if the pa bandpass relays are clicking as they should and making/breaking contact.

Topic: 19814  Message: 19814

Hi, I wonder if anyone can help with a fault which has developed on my 706 mk2.
Whenever I key up on VHF FM there is a short period , abt 2 seconds, when there is no mic audio and the ALC meter goes to full deflection.

Then there is a slight hissing noise and the audio returns and the ALC meter drops back.

It's the same on VHF SSB but everything is fine on HF SSB.

I've tried to figure out what the problem is but can't see anything obvious.

I'd be very grateful for any advice.

Thanks
George. G0RLF.

# 19817. 706 almost deaf as a post

Yahoo group: ic706 (2010 — 2015)
Date: 2012-06-15 18:09:01 UTC
From: piratdxer
Topic: 19817  Message: 19817

Sorry if this has been covered before, but 20,000 messages is a lot to look through and I'm on dial-up...

My original 706 seems pretty deaf on certain bands. I can tune it and my Yaesu FT8900r to 52.525 FM and the '8900 will hear signals while the 706 doesn't. (Yes, I'm using a 6m antenna on the Icom.)

On 19m shortwave the 706 on an Alpha-Delta "twin sloper" doesn't hear anything while my R-75 rcvr on a 150-foot longwire does.

It seems to hear OK when I get down to 31m and below.

Does it need to go for servicing? Any suggestions are appreciated.

I have a friends IC-706 here that will not give me any output in HF or 6 meters and will not TX on 2 meters. Also the 2 meter Band is strange, when you get to 146.000 the next click of the dial clockwise goes to 0.030.00 and RX goes dead.
I know it should go to 148 mhz anyone run into this?
I checked the voltages on the Finals and they appear fine.

Are you in CW mode? If so, be sure the QSK feature is set for either
"f-break" or "break". The third option will turn off the output so you
can use the rig as a practice oscillator.

Hi Chris, Is Q5 the Relay Transistor? If so, where is it located on the board? My Copy of the service manual is poor and I can not read which part is Q5. If it is the one I think it is, it is under the white Rubber stuff that looks like it will be a nightmare to remove.

Thanks

Gordon

Hi Gordon,

As far as I remember I have circuit diagrams of 706MkIIG , but right now I am at my summercottage so I dont have access to them. Which model 706 are you asking for ?

Best regards
Carl

Anyone have a really good Service Manual? The copy I have is too blurred to read the boards when blown up to readable size.

Thanks,
Gordon

# 19826. IC-706 Identification

Yahoo group: ic706 (2010 — 2015)
Date: 2012-06-30 16:33:59 UTC
From: Harry Herr, W6HH
Topic: 19826  Message: 19826

Hi Gordon,

The European Version tuning range is limited to 144-146 MHz and likely has some kind of compliance ID on the serial number tag at the rear of the left side. I confess I have never seen the EU version but the US version has the FCC Part 15 ID on the S/N tag. Hence, if it has a Part 15 compliance ID it is NOT an EU version. All the versions are shown in the table below:
The tuning range for each version is shown below:

If you have a website I can upload the service manual. I don't recall where where I got my copy, perhaps Mods DK. In any event I found it with a Google search. If you can not find it, or if you need any other info, just let me know and I'll help. Another thing, There are at least 2 different PDF versions, one is only 4 KB the one I have is 29 KB.

73 and gook luck - Harry

P.S. Sorry about all the different fonts, I'm an inept publisher!

Hi,
My 706MK2 is suddenly only giving 5W RF power out.

It works fine otherwise.

I have done all the usual checks/resets and used a dummy load and power meter to check it.

Does anyone have any idea what the cause of this may be.

Thanks!

Is this on all bands?

One possibility to check would be all mechanical connections inside radio.
Tighten all screws on circuit boards as ground return paths depend on a
good low resistance connection.

That sounds to me like driver power making it to the antenna jack; I'd check the finals, they are rugged but they do fry once in a while.

I have a G so not real familiar with the MKII but doesn't it have two rf amps? One for HF and the other VHF? I wouldn't expect a radio to lose all rf out on two separate rf amp stages. That would make me think something else is going on there.

# 19835. MKIIG no power output.....

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-04 19:31:51 UTC
From: Brandon
Topic: 19835  Message: 19835

I have a MKIIG and every time I key up the power meter shows no power out. I switch to AM mode to tune the tuner and nothing. The rig powers up, RF out setting is on high. When I switch bands and try to listen, nothing. I'm no electronics expert so I'm totally stumped. I do have another MKIIG that I had to use as a parts radio to get this one working (it was working fine up to about 4 days ago). Resetting did nothing. Checked all connections. Antenna is still up. Any ideas?

Sounds like short circuited/broken co-ax or broken connecter at the PCB.

Disconnect the antenna entirely, stick a piece of wire in the connector, I usually check the SW broadcast bands and FM broadcast bands with an 18" piece of wire with a banana plug or a lead from my multi-meter, it's quicj and easy if you don't have a second know good antenna source. If you don't hear anything, open the radio and look at where the RF connectors meet the circuit board, use a light and magnifier and check for cracks and wiggle. Beyond that, someone else can help.

Kurt

From: grumpyom2003
Topic: 19837  Message: 19837

Does anyone have an original MK2 (not the G or the original) service manual? I'm trying to find the location of a couple of parts on the Main board. The copies available on the internet don't have enough resolution to show the part numbers for the chip caps and chip diode pairs.

Specifically, I need the Main board location of C158, D48 or D46 to add an IF tap.

Can anyone help? Thanks.

# 19838. Lo Rx, no Tx on HF

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-08 17:57:31 UTC
From: awaschka@bellsouth.net
Topic: 19838  Message: 19838

I am troubleshooting a problem in my 706 that was intermittent and is now consistent. The symptoms are low rx sensitivity and no tx on all hf bands. VHF works fine. I have measured sensitivity to be 500 uv for S9 on all bands with the preamp on. Preamp and attenuator functions work as expected, dropping the signal level appropriately when the preamp is turned off and the attenuator is turned on. I have put an antenna analyzer into the hf antenna connector and measured the SWR of the input which is in the vicinity of 2:1 when a frequency in the proper range is selected. This tells me that the filter board is working and is getting the proper control signals. I have measured the voltage of the LOs and find the 60 MHz LO2 to be about 200mV peak to peak and the tunable LO1 to be somewhat less, on the order of 50-60 mV peak to peak which seems low. Unfortunately my service manual does not have any RF signal level measurements (that I can find).

Does anyone have the required levels for the LOs at the input jack on the main board?

Hss anyone troubleshot a similar problem?

Thanks,

Al K5TAN

# 19840. New Data Re: Lo Rx, no Tx on HF

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-08 20:48:41 UTC
From: awaschka@bellsouth.net
Topic: 19838  Message: 19840

I realized that the VHF receive goes through the same IF chain as the HF, using the same LOs. The main difference is that the VHF Rx chain bypasses the filters in the HPF board, but does go through the preamp and attenuator. Since the preamp and attenuator appear to be working for me on HF, I have concluded that my problem is in the filter area on the HPF board. Does anyone have any experience troubleshooting/repairing the HPF board?

Thanks,

Al

# 19841. IC-706 MkIIG CW overdrive?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-08 19:15:48 UTC
From: Peter
Topic: 19841  Message: 19841

Hello -- I'm new to the group.
I have a question about my IC-706MkIIG in CW:
When I go to 10 mtrs, using a ladder-line feedline to a dipole with loading coils at both ends, I get a warbling sidetone, and the intensity of the light behind the readout increases. Also, and this happens on other bands as well, when I go to full power (H on Q1 menu) the power indicator on my MFJ-949D tuner indicates that I'm putting out 150W.
A friend suggests that maybe in CW I'm overdriving the finals.
Is there a way to adjust the drive in CW mode?

Thanks for any help/insight.

Peter KO6R

I may have answered my own question.
First of all, I put a different tuner in line, a Dentron Super Tuner Plus, and added in a Daiwa cross-hairs meter. Now I show 80-90W output, and with some deft fine tuning, got rid of the warble on 10 and the increased intensity of lighting of panel.
I think it more than likely that I was underdriving my brain rather than overdriving the radio.

Peter KO6R, who laments that he got too soon old and too late smart.

Peter,

What you were getting with the old set up was RF feedback. The increased brightness may have been the result of increased voltage from the power supply whose regulator was affected by the RF.

Good luck with the new arrangement.

# 19844. Heil HS706 headset

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-09 19:38:21 UTC
From: John
Topic: 19844  Message: 19844

I'm thinking seriously of upgrading my IC706MKll to an IC 7000. Will the HS 706 headset work on the 7000?

Any thoughts on the 7000 would be appreciated also.

john, WA8KIW

From: Larry J. Ford
Topic: 19844  Message: 19845

Is the Heil HS-706 the same as the Heil "Traveler" Headset? If so, there should be an adapter cable that the headset connects to that will work with the 7000, if it's not already compatible.

My Heil Traveler cord terminates in a 8-pin female "round Foster plug" connector just beyond the "PTT" pendant. You can purchase an adapter cable that the Traveler cord connects to which in turn terminates in either an 8-pin RJ-45 (CAT 5) type modular plug (e.g. for the 706) or one that terminates in a standard 8-pin round Foster connector.

If the 7000 mic connector socket accepts the 8-pin RJ-45 (CAT 5) type modular plug like the 706, then the same may work in the 7000 as well (if the pin assignments are the same).

Bob & everyone-

Thanks to all for digging into this. Ralph, ZL1TBG, took a close up photo of the page in question and, I think, enhanced it. The result makes it very easy to see the parts and circuit traces in question. That solves the problem.

# 19848. Auto Tuner LDG AT 11 MP

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-15 10:13:01 UTC
From: Music Maker
Topic: 19848  Message: 19848

Hello Happy Hamsters,

Thank you for having me as a member of the Group.

I have joined, as have just purchased a 706 Mk 1 on the Flea Bay (with most of the accessories), It should be with me on Wednesday.

I have also bought an Auto Tuner via Ebay from a UK major Dealer (Waters & Stantion) an LDG AT11MP Tuner for it. It appears - looking at the back of the tuner in the pictures (That item too will be here mid-week) that there is a special 3.5mm socket marked '706' on the back of the tuner.

Can anyone please tell me (from experience) if this combo works OK, and that the 'Pluggery' I have ordered from USA is a good investment (The lead supplies power to the Tuner as well as Tuning data).

Next - I am looking for a 13 Pin Din connector for my existing SignaLink USB Datamode Interface if anyone has one spare, obviously, I will pay and for shipping. Tigertronix want about 45 dollars plus 20 Dollars to ship - Far too much for this poor Old Age Pensioner !!

Finally, if you look on my QRZ page, there is a link to my Web Site which has loads of stuff on it, Ham Radio, Digital Modes, My American Wife's Music (and mine !! - we are both retired Pro Musicians), German Shepherd Dogs, Genealogy, etc., I am sure you will find something of interest there to keep you out of mischief (or off the air) for an hour or so !!

Don't know if a direct link will work on Group Posts - but here it is .... AMATEUR RADIO PAGE <http://musitronixbiz.ipage.com/ham-radio.html>

From: Ken Winterling
Topic: 19848  Message: 19849

John,

You didn't indicate that you had the manual for the tuner so I attached the LDG AT11MP manual and also included your direct e-mail address as a Cc: because the reflector will strip the attachment. You can also obtain the manual for this discontinued product direct from the LDG site via the following link:
http://www.ldgelectronics.com/assets/discontinued_manuals/at11mp.pdf.

The connection of the tuner to the Icom is explained in the manual as well as the operation of the tuner without the connection. Yes, the AT11MP works nicely with the IC-706. I originally had the same tuner but passed it along to my son when I got an AT-200 Pro.

As for 13 pin DIN connectors, have you looked (I didn't) on the UK ebay? You may find what you want and the shipping should be cheaper.

73,

Ken

John,

Don't buy JUST the 13 pin DIN connector, get one with the wires already attached.(pigtail on the connector) The connectors we've been getting here in the colonies are the cheap plastic ones and are very sensitive to heat from a soldering iron. They almost melt on contact. Spend the extra and get the wire attached...

Date: 2012-07-16 21:28:25 UTC
From: dfas_eu
Topic: 19827  Message: 19851

Hi everyone,

I have the same problems with mine. Did reset but nothing happens. The power is sometimes 4, when cold up to 5 watts. What makes me wonder is that it gets really warm too. I also have a IC-706 MK1 which does fine and will not get as hot with 50 watts running. Anyone found a solution for this problem yet? I checked all connections, screws on the boards etc. Have no idea what is going on. Had it at a dealer also and it came back with the notification - everything ok (transistors) but power can not be adjusted through the menue.

Would really be great if someone solved that problem befor.

Thanks
Harry

From: Seli O
Topic: 19852  Message: 19852

Hi,
Recently I got a 706MKIIG and as I had the older type MKII, I moved the filters and the Better RF tune control to the new rig. But, the tune control doesn't work at all, but it's faulty as I tried it again on the MKII, and works there. Is there any history of the MKIIG Molex connector unit gone bad, due to, for example RF problem? Any special menu settings to get this working, I've tried few? 73 Seli TF3AO

There are settings in the manual that need adjusting. You can compare the MKII settings if you don't have the manual.

Thanks guys for your advice and assistance, But in spite of the 706 arriving this morning from the seller, having a 13 pin Din Plug, with a length of cable stripped back with the different coloured wires visible, I have taken your good advice, and ordered the correct control lead from America, at 19 Dollars US.

I am now going to do a post on my next requirement.... a CIV Cable !!!

Again, many thanks to those who responded,

John (G3OBU)

.

CIV cables and plugs for 706 Mk 1

Does anyone have one of these sets of cabling / plugs in their Junk Box please? Obviously, I will pay for it plus Post and Packing.

Otherwise, is there any way to find the kit .... I want to use HRD to control the rig, as the buttons are all too small for my banana-sized and arthritic fingers !!, and as a State Pensioner, I don't have a lot of cash to spare on the luxuries of life.

Suggestions and comments welcome.

Thank you and 73

I would say look on EBAY.  They can be had for around $ 20. That is the buy it now price so they will ship right out.  If you are in the UK, about 15 pounds including shipping from dealers there.  If you want to wait, China has some for maybe a few dollars less.

Just search for Icom cable.

Hi All

Just got a 706 mk1.
It all appears to be working so far.
Had a couple of qso's on 80M.

Received audio in ssb mode seems very tinny and a little scratchy even with headphones plugged in - is this normal for a mk1 ?
Using the IF shift to cut the higher frequencies seemed to improve it a little.

My reports for my transmitted audio were clear but apparently tinny and lacking bass.
Someone described it as military quality - is this normal for the mk1

The NB certainly working but is there any way to adjust the nb level?

That will do for now

There is a pin on the 4 pin plug that applies the voltage to the tuner. If the rig has been used with a tuner other than the Icom tuner, it could be that the tuner drew too much current. There is no fuse in this part of the circuit, so the board traces become fuses. Check the board for evidence of charring in this part of the circuit.

My MKIIg has this problem but there is no charring of the board. A dog chewed through the control lines going to my SGC 237 coupler. The wires shorted and the next time I tuned, zap! This can also happen if someone plugs a connector into the 4 pin socket that has been mis-wired.

Hi John,

I made up this simple interface as found at
http://www.qsl.net/g3vgr/civ.html

The PTT I already had a home made data interface and use a opto-isolator
for CW and a relay for data via a switch (the back data port needs a
true zero ohm that the opto couldn't give but the relay isn't fast
enough for the CW switching)

I don't know how well the 706 works on 12V -- it's designed for 13.8V -- but it might run OK for a short time at low power on a freshly charged 12V gel-cell or other sealed-lead-acid battery. How much weight are you willing to carry around? 12V 7Ah to 8.5Ah batteries are reasonably small and not too heavy, but the weight and size increase with increasing capacity.

If you have a Batteries Plus store near you, you could look at what they have and get some idea of the size and weight for a given capacity, but their prices are high. I've bought sealed batteries for Uninterruptible Power Supplies from Chrome Battery on eBay; you can check sizes and weights on their Web site.

I have an ICOM IC-706MKII and for the last 3 years, I've used a Walmart 75 AH Marine Battery, and found it will run the 706MKII all day for Field Day, public service event, ARES drills, and the like.

I do keep it on a charger, and it gets a 45 minute "boost" every evening at a 6 amp charging rate.

Must be working because it shows no signs of losing capacity after 3 years.

After years of using 12 volt batteries in applications where the batteries get used sporadically (e.g., aircraft stored in hangars, etc.), I've found the key to long battery life is regular charging (if the aircraft, etc., is not used on a regular - i.e., daily or weekly - basis to give the battery a good charge).

Anyway, that's my story and I'm stickin' to it!

Not sure what you expect. You're dealing with a radio that will draw
around 20A when keyed. That won't last long without being charged.
Also, the rig may not be stable when the voltage gets low. I sure
wouldn't want a puny little thing if I was going portable with it.

The Icom 706 draws about an amp just on receive.  To operate for 8 hours, you will need a battery rated at 8 AH or more just to receive.  Then if you operate at 50 to 100 watts, you will need lots of AH.

Portable operation for that rig will take a car battery size.  The QRP rigs use the 10 or so AH batteries draw in the miliamps to receive and often 5 watts or less to transmitt.

Again, portable means differant things to differant people.

Afterall,for field day, our club operated portable with a 20 kw generator.

And it draws 6A keyed, with *no* RF output. So even if you turn the RF power down to 5W out, you're still going to be drawing appreciable current just for bias.

I was thinking of "Go-Bag" portable, such as one of our club members demonstrated a couple of meetings ago: it was one of the small Yaesu rigs rather than an Icom, but he had a battery such as I mentioned previously -- a battery with a capacity less than 10Ah.

That might work for "portable" operation with an IC-703 QRP rig, but not for long for the 706, for reasons other folks have so aptly pointed-out.

Also, you have to be concerned about voltage sag in the supply voltage to the rig at any setting approaching full power. The big, honking 75AH battery will provide at least 12.5 VDC to the 706, key-down, full power setting, and will do it all day long, as it has plenty of current capacity. Now the 706 may not put out a full 100 watts on 12.5 volts (there's a chart floating around somewhere which illustrates the power-out vs. supply voltage relationship), but it's probably around 90 watts.

Speaking of size and carrying, I have a nice battery box with carry handles built-in. The 75 AH battery is not exactly "light" (it is a sealed lead-acid battery), but even with my bad back I can pick it up, put in the vehicle and get it to the site.

If you want a battery that will fit in a "bag," I suggest you stick with a hand-held! The 706 needs something way more substantial.

Keeping a marine battery float charged seems to offer benefits, plus an old adage I read a long time ago, of not to keep batteries on
a concrete floor but raised off it - they do not like the cold.

A colleague who passes on old UPS batteries from his company, they are also good - only old due to timeline, not reliability.

I can get somewhere between 1 and 2 hours on a single 7Ah gel cell at 5W out with Field Day CW duty cycles. An SLA jump start pack will about double that.

Well, this is a 706 list! ;-)

A friend was deployed to the bottom of the Grand Canyon for 2 weeks with his job as a biologist with the US Fish & Wildlife Service (surveying fish populations in whatever flows down there - Colorado River, I suppose) and planned to run his 706 on CW QRP mode off a 7 AH gel cell battery, which he planned to recharge during the day by a portable solar panel array (roll-up) type.

Guess what? It didn't work, as he discovered - too late - the almost 2 A draw of the 706 on receive, not to mention the high current draw even on 5 watts transmit. The 706 drained that little 7 AH battery so fast and so badly, he got maybe 30 minutes or so operating time, and then the portable solar recharger could not fully recharge the battery even after an all day charging session.

For the following year's deployment, he built the Ten-Tec CW QRP kit, only to win a Yaesu 817ND at a hamfest right before he went back to the Grand Canyon! Talk about luck!

Not familiar with those rigs, but yes. If you are serious about going portable, you should look at a rig built specifically for QRP/Portable operation. For one thing, they concentrate on getting the receive current drain as low as possible. No lights, etc. They can get down to the milliamp range on receive if designed right.

I was considering building myself a LiFePO4 battery pack for my radio. You can get 10Ah cells with screw terminals and can handle up to 100A discharge. They are commonly used for electric bicycle projects.

I use two lawnmower batteries in parallel for "emergency" power. They fit nice in a single battery box. At my house, "emergency" has nothing to do with contesting during a power outage.

"Lawnmower batteries?" For an electric, cordless lawnmower, or the small, 12V batteries like are used in my riding lawnmower?

What's the capacity of what you use?

# 19882. Distorted transmit audio on HF SSB and power issue - need help!

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-20 17:44:52 UTC
From: Stuart
Topic: 19882  Message: 19882

Just bought a 706 Mk1 but looks like it has some faults.

Getting reports of heavily distorted audio on hf ssb.
Also when using compression maximum output seems to be close to 100 watts. But when transmitting without compression peek ssb seems to drop below 50 watts even with the mic gain on max.

I've monitored the transmitted audio on another receiver and no combination of mike gain with compression on or off gets rid of the distortion.

I've opened the HM103 mic and a disk of rubber was floating around loose in the back
The mic insert is only about 5mm diameter and 5mm long and is just stuck to the inside of the mic's front panel grill, is this how the hm103 is meant to be?

Any idea's with the faults?

Thanks

Stu

Have you checked the power supply voltage? I know for a fact that low supply voltage will cause audio distortion on SSB transmissions with my 706MKII.

The output meter on the radio will look like you're only getting 30 - 50 Watts at full output. You probadly are overdriving the radio.

And I still recommend you check the supply voltage under load. I've got two 706s (1 "original" IC-706 and 1 IC-706MKII) with the stock factory HM-103 hand mic, and I've never had to remove the rubber disk to get good audio reports.

However, let the supply voltage get much below 12 VDC and you'll have problems (spec is 13.8 VDC, plus or minus 0.15).

I was trying to operate on a battery that was showing in excess of 12.5 VDC not under load, but was sagging when the radio was keyed and dropping below 12VDC and I got distorted audio reports from receiving stations. Switched to a more stable supply and the distorted audio went away.

# 19889. Wiped out by local broadcast station !!

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-22 05:33:06 UTC
From: Music Maker
Topic: 19889  Message: 19889

.

Hello Happy Hamsters,

Icom 706 Mk 1

I live about 500 metres from a local AM brodcasting station on 1503Khz at 2Kw.

In AM mode, I can hear nothing over the whole HF spectrum (absolute silence), other than if I tune to the offending transmission, which then comes in at S 9+90db, with the rigs 20db attenuater switched in. Surprisingly, at any random frequency up to around 15Mhz, if I switch the mode to Wide FM, I can hear the transmission (although it is AM) quietly but clearly.

I use a Cushcraft Vertical MA5V antenna, through an LDG Auto Tuner (AT-11MP), and certainly - when that is tuned on a frequency, the signal can no longer be heard in wide FM anywhere, and I am able to use the Transceiver on any band SSB with no problems, other than perhaps a little less sensitivity.

My other transceiver (an Icom IC-746PRO) does not exhibit any of these symptoms an the same antenna.

I have posted on several 'Ham' Forums about these problems, and basically get these answers ...

1, The 706Mk1 is a piece of rubbish - sell it.
2. The 706Mk1 is notorious for having poor 'Front End' filtering and is easily overloaded.
3. Send it to a reputable workshop, or even Icom for a re-alignment and check over.
4. Make a simple 'Notch' rejection circuit with high'Q' circuit using a varable capacitor and a coil in parallel in the coax centre conductor tuned to the offending frequency (1.53Mhz).

Comments please, preferably written on 100 Dollar Bills, to enable me to put this rig in the junk box, and buy a new 857 or Alinco DX70, as I am a 76 year old penniless pensioner !!!

73 to all

John (G3OBU)

Holy Cow, John, what would cause you to move/live that close to an AM broadcast station? You must have known there would be problems. I agree, the notch or a HP filter is the best cheap bet to make your Mk 1 useable.

# 19892. RT-11 to IC-706 cable pin connections

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-21 19:51:06 UTC
From: yg@internetsmallfry.com
Topic: 19892  Message: 19892

Does anyone have the correct pin connections for the cable that goes from the DB-9 connector on the RT-11 to the 4-pin tuner connector on the back of the IC-706?

There is a file in the Files section of this group called "RT11 Remote.GIF" that shows a connection diagram but I can't see how it can be correct. It shows the 706 pin 2 ("Start") as going to pin 2 on the RT-11... but pin 2 of the RT-11 is the "Tuner bypass" pin whereas pin 3 of the RT-11 is "Tune control". Seems like pin 2 on the IC-706 should go to pin 3 on the RT-11, not pin 2.

Since that connection appears to be wrong, I don't have a lot of confidence in the connection shown for pin 1 on the IC-706 (the "Key" pin) going to pin 7 on the RT-11 (which the RT-11 manual describes, rather uninformatively, as "Radio out. This line is used in the tuner interface with Icom and Alinco radios.").

My best guess, from searching all over the web, is:

ICOM RT-11
1 <-- 7 (NOTE: NOT sure about this one)
2 --> 3
3 --> 1
4 --> 8 & 9

RT-11 pins 2, 4, 5, and 6 are not connected.

Is that correct?

Thanks...

Rick WA1RKT
Londonderry, NH

But NOT the typical HP filter. Typical Ham HP filters attenuate below 30 MHz and pass TV Channel 2 and above.

My filter design courses date back to the 50s. But, either an m-derived image parameter design or a Butterworth design with a corner frequency of 1.6 MHz should help quite a bit.

Give me a direct email and I will respond with the paper schematic of an image parameter design that can be packaged in a radio shack box and left in line. You will have to work the packaging details.

I'm a retired EE and almost 60 years of hammin :-)

Dave, W1MCE

Good Morning Guys, .. Its a lovely sunny day, here in Gods Own Country !!

It sort of negates the terrible recent flooding, and the current poor state of the Amateur bands, less than a year until another Sunspot Maxima. After being active for the last 5 of the 11 year cycles, I can say that they get weaker every time !!

Enough 'small talk' - and on to my problem ... sadly, in spite of moderation being desireable on these Groups - a lot can happen in the intervening space while posts are held in cyberspace for long periods!!

A member wonders why I chose this QTH, so close to a powerful AM Transmitter..... I didn't choose it! ... Due to mobility problems, I had to move into a retirement complex, with a bungalow that was currently vacant. This was the only one in my local area.

OK.... Problem is now solved .... I wrote to Tony at Spectrum Communications UK (worth 'Googling' as they manufacture some really interesting stuff !), and got the following reply.

(As the subject may be of use to others, I have posted the Table he used and the circuit diagam of the Eliptical 5 Pole Band Filter in the Photo's section as 'Filter Table' )..............
Dear John, I presume you are still a transmitting amateur, in which case a rejector circuit would not allow you to transmit. Likewise a notch could cause trouble on harmonically related bands. What you need is a high pass filter, capable of carrying the full output of the rig anywhere in the HF band. If you want to use top band then it makes this quite a task. If you are happy with 80m and above then the design is eased considerably. Nevertheless the coils and capacitors will need to be capable of carrying the circulating RF currents. I have looked at various designs and found an ideal one. It is the 5 branch elliptic high pass filter, number 18 in the table in the ARRL handbook 1996. It has zero loss at 3.48MHz, is 49.9dB down at the attenuation floor As from 1.57MHz and down. It has an infinite attenuation pole at 1.50MHz so may even achieve as mush as 20dB more rejection at that frequency. From the table C1 is 1n5, C2 is 14.1nF, C3 is 680pF, C4 is 4.94nF, C5 is 1n8, L2 is 1.96uH and L4 is 2.28uH. Coils L2 and L4 must be well screened from each other to achieve good performance. I can manufacture such a filter but it will take some time to get the inductances right. It is quite possible they can be wound on suitably sized toroids, which helps keep coupling to a minimum. C2 can be made from 10nF + 3n9 + 220pF. C4 can be made from 4n7 + 220pF. I guess such a filter will take between 2 and 3 hours work plus parts, maybe £75, plus some P&P. Regards, Antony Nailer G4CFY. I have ordered one, at 75 GB Pounds (110 US

Dollars). Lets hope that is my problem sorted .... Thanks again for your time, advice, and interest 73 John (G3OBU)

# 19896. fl103 filter

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-23 16:33:26 UTC
From: ray
Topic: 19896  Message: 19896

I just installed the fl103 filter in my 706mk2g and did'nt notice any change in audio rec in ssb. this was installed in the opt 1 or pos 1 and the turned on in the SET mode.To check further I placed rig in psk31 mode (waterfall) and noticed this rig has 2.8khz bandwidth when the filter in OFF and of course when on (w in display) no change. The narrow filter I installed in the other (opt 2 ) location works fine.So I am a bit confused....is 2.8khz normal and I don't need this filter....(has this rig been tweeked?)...should I find a 2.4khz filter to confirm my theory?...KF0AF

>

You may be expecting too much. These filters don't seem to be anything like the ones I'm used to with Kenwood. If you put in a 2.8KHz filter, that is barely different from stock. I put a 1.9KHz filter in and could barely tell the difference. Luckily, I didn't pay much for it. Going rate seems to be around $60-70.

The stock filter is 2.4khz, so the extra 400hz probably won't be very noticable on SSB

I agree, I've become a fan of somewhat broader receive bandwidths as a result of some commercial gear, and the newer amateur DSP stuff.

I had hoped I'd have the same listening experience with the 2.8 khz filter, but it's just not like the 3 to 3.2 khz DSP stuff, and is barely different from the stock filter, unless there is adjacent QRM, in which case you run the narrower filter anyway :)

The full service manual is available at the website shown below.

http://www.mods.dk/

Look in the Manuals section and find the IC-706MKIIG Service Manual that indicates REVISED June 2007. It is a zip file.

The parts list reflects the new Mitsubishi RD70 finals. You must be registered on the site which requires an email address and password.

# 19906. Using the 706 as portable

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-27 18:31:10 UTC
From: John
Topic: 19906  Message: 19906

I am planning to go for a trip likely to take 7-10 days. I will be stopping at motels and friends every evening, so charging the 7.5 amh battery is not a problem. It sounds as though the big problem is not completely discharging the battery when I am operating. So if I limit operations to 10 watts or less (levels 2 or 3?)for less than 2 hours and recharge every night, I should be ok. Opinions solicited.

Are there any other precautions I should take, other than buying a 703?

From: John
Topic: 19907  Message: 19907

As a new owner of a 706MkIIG, I am puzzled already. My other rigs have a tune function that gives me some power to set my manual tuner for the band I am on. The instruction book says I can push the tune button for 2 seconds and I should see something but that appears to be none-functional. Is there another way short of switching to cw and going key down?

Topic: 19907  Message: 19908

I have two 706s.

The "tune" function on the 706 is enabled ONLY if there is an ICOM AH-4 (or compatible) autotuner (the instruction manual explains this) OR one of the AH-4 tune "emulator" devices plugged into the 4 pin Molex connector on the back of the rig.

You can make one of the AH-4 emulator devices using one of the circuits published online if you're handy with a soldering iron.

Get a bigger battery.  Before you go , give it a try from your house.  The 706 is very power hungry.  It draws an amp or more on receive and several amps on transmitt even on the lowers power setting.

From: LARRY J. FORD
Topic: 19906  Message: 19910

According to the specs for the 706, at a supply voltage of 13.8 VDC, it draws 1.5 amps on "squelched" receive and 1.7 amps on receive with "Max audio."

If the supply voltage is less than 13.8 VDC (pretty much a certainty with a battery), I would expect the receive current draw to be even higher.

A friend took a 706, an 8 AH battery, and a portable solar panel to the bottom of the Grand Canyon with the hope of operating QRP CW (5 watts). He got, as I recall, something like 45 minutes operating time before the 706 drained the 8 AH battery so low the 706 refused to operate and the portable solar panel couldn't fully recharge the battery.

Or, if you're lazy like me you can buy one pre-made such as the Better
RF Tune Control

http://www.betterrf.com/706-tune.html

I have one for each of my rigs for back up to my LDG IT-100
(shack/portable) or Turbo Tuner (mobile).

I used one for a year or 2 with my manual tuner in the shack until I got
the LDG unit. I was happy with it and had no problems. Switched to the
LDG as it performed better than the old manual I had. And did I mention
that I'm lazy? :-)

Randy,

I got a "store-bought" one as well, not a Better RF, but one off eBay made by another ham, which has worked quite well for several years now. Next time out, however, I'll give it a shot at not being "lazy!" (Although, usually I get right in the middle of one of those "projects" with a hot soldering iron, solder spools and parts lying about, taking twice as long as I thought it would, trying to figure out how to undo or work around the "Oops" I just created, and think "I could have just bought one of these!")

# 19914. Accuracy of SWR Meter

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-29 22:25:07 UTC
From: KAWill
Topic: 19914  Message: 19914

Have others noticed that the SWR Meter in the IC-706MKIIG may not read the same as an external SWR Meter?

I have a Bird Model 43 Wattmeter connected to the radio using about 18 inches of 50 ohm coax. When one meter shows no reflected power, the other meter typically shows more than a small amount of reflected power.

My antennas are Inverted V dipoles with the ends lowered to achieve a low SWR. One thought is that perhaps these antennas present a reactive load to the radio rather than a purely resistive 50 ohm load.

Thanks for any thoughts.

Some meters will show diffearnt ammounts of swr depending on the power level.  This is normal.  As long as the swr is low (say less than 1.5 to 1), and the rig puts out the power it is suspose to , do not worry about it.

Most simple antennas will have a combination of resistance and reactance.  Even if you do manage to get one with out any reactance at 50 ohms, as soon as the frequency is changed very much, you are still back to the swr problem.

Sometimes swr meters will not read the same even if placed in the same place in the coax. They are not that accurate.

There's a service menu and adjustments for this if it bothers you. beware the null adj is fragile and parts are not well rated so could have shifted cal. You need a t connector and 2 50 ohm loads to do it.

# 19917. Re: [ic706] Accuracy of SWR Meter

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-30 03:37:22 UTC
From: Wayne Bowyer
Topic: 19914  Message: 19917

I've had my 706G for probably 11 yrs. I've never considered any of it's meter readings to be extremely accurate and really haven't worried about it. I consider them to be basically "relative" readings. I've never had a mobile radio with really accurate meters. I've used a MFJ-259 for adjusting mobile and fixed antennas and for grins I double checked it's results with an Anritsu 331D sweep gear as well with a Bird 4304, (When I was still working in the wireless industry) The 706, 259B, Bird and the Anritsu were all close enough for "government work" as we used to say. The 706 and 259 weren't accurate enough for lab purposes but more than accurate enough for amateur work. I even took the 259B with me to South Sudan in 2005 to aid in tuning up a 500' long rhombic we built for 6 mhz. It did the job nicely. So now I use my 706 at home in conjunction with the AH4 wire tuner. I have a vswr meter in line as well and the rig's meter agrees with it.

From: Lefczik, Larry D
Topic: 19914  Message: 19918

Are you saying one meter shows !:! and another shows 1.5:1? How much difference?

As you may know, the SWR reading can vary along a transmission line if there is any SWR. Have you tried comparing with different jumper lengths to the rig? Have you compared with a 50 Ohm Dummy load? Have you compared on different bands?

Subject: EXTERNAL: [ic706] Accuracy of SWR Meter

Have others noticed that the SWR Meter in the IC-706MKIIG may not read the same as an external SWR Meter?

I have a Bird Model 43 Wattmeter connected to the radio using about 18 inches of 50 ohm coax. When one meter shows no reflected power, the other meter typically shows more than a small amount of reflected power.

My antennas are Inverted V dipoles with the ends lowered to achieve a low SWR. One thought is that perhaps these antennas present a reactive load to the radio rather than a purely resistive 50 ohm load.

Thanks for any thoughts.

From: KAWill
Topic: 19914  Message: 19919

Thanks all for your help on the SWR readings.

I think part of the problem is the resolution of the IC-706 SWR Meter which is a fairly coarse bar graph. It appears to only provide readings such as 1:1, 1.25:1, 1.5:1, 1.75:1, and 2:1. Above 2:1 the steps are even larger.

The readings provided by the Bird Model 43 do not vary a great deal but it is noticeable. I have not studied the differences in detail or with a dummy load. Perhaps the length of the coax to the meter is a factor when there is reflected power in the line.

My guess is that the sensing circuit in the IC-706 is not as precise as the circuit in the Bird 43. It's also possible that the IC-706 is off somewhat from 50 ohms. I believe in both cases the circuit is attempting to measure reflected power.

That brings up an interesting question. I wonder what happens if the impedance at the end of the feed line is 50 ohms but that impedance is not purely resistive.

One other concern might be that the IC-706 reduces power above a certain threshold which may not be entirely accurate.

You did not say what the differance in the SWR is between the two.

Almost all antennas will have some reactance in them, especially if used over a range of frequencies.  The resistance and reactance sort of add together to give an impedance.  More complicated than I care to go into in a short message.  If you have a resistance of 50 ohms and a reactance of 20 ohms, the swr will not show up as 1:1, but another value.  If the impedance is 50 ohms, but some of it is reactive, the risistance part of the antenna will not be 50 ohms, but another value.

The 706 does reduce the power as the swr goes up.  That is why an external tuner of some sorts must be used on many antennas.  One that does not usually need a tuner , but is adustiable such as the mobile screwdriver types.

Could it possibly be the other way round? Temp in the 70's allowing the rig to cool down, then warmer humid air coming along and resulting in condensation. I used to have condensation on most of my larger metal tools in the shed whenever warm, humid weather followed cold. Then I bought a mains powered dehumidifier and the problem went away.

Yeah, like that.

Night time temps around 73.
90+ for a daytime high, with increasing humidity
Then the afternoon storm breaks, and the temp drops to about 75 in the
space of a half-hour or so.

A mains powered dehumidifier would be just the thing.... except this
radio is mobile-mounted.
I'm not sure I have an extension cord long enough. HIHI

I thought about one of those chemical desiccant things, but I have
this feeling it wouldn't last long.

# 19925. Re: Accuracy of SWR Meter

Yahoo group: ic706 (2010 — 2015)
Date: 2012-07-31 20:37:42 UTC
From: KAWill
Topic: 19914  Message: 19925

Thanks again to everyone for your help. I ran a few tests today using my 20 meter Inverted V dipole with W2AU balun at the center. The ends were lowered last year to minimize the SWR which turned out much lower than expected. The antenna appears to be resonant at the low end of the band right now with the ground very dry.

There is a modest difference in the SWR readings between the IC-706MKIIG and the Bird 43. The Bird 43 shows reflected power in Watts which is converted to SWR using a formula or chart. Tests started with 18" of coax between the IC-706 and the Bird 43.

I ran tests from 14005 Khz to 14345 Khz. Reflected power on the Bird 43 started at about 0.2 watts (1.1:1) at 14005 Khz and slowly increased all the way to 4.5 watts (1.54:1) at 14345 Khz.

The IC-706 showed 1:1 at all frequencies except 14005 Khz where it indicated 1.25:1.

I then added 31" of coax using a double female barrel connector to the end of the feedline. Surprisingly, the reflected power indicated on the Bird 43 declined quite a bit. It started out at essentially zero watts (1:1) at 14005 Khz and was only 1 watt (1.22:1) at 14345 Khz. I just repeated the test and the numbers are correct.

The readings on the IC-706 showed 1.25:1 at both ends of the band and 1:1 at 14100 Khz.

In the final test I removed the 31" of coax and added it to the 18" section of coax between the IC-706 and Bird 43.

Readings on the Bird 43 started out at 0.5 watts (1.15:1) at 14005 Khz and rose to 4.5 watts (1.54:1) at 14345 Khz. The readings on the IC-706 showed 1.25:1 at both ends of the band and 1:1 at 14100 Khz.

In conclusion, there are noticeable differences between the two SWR meters. The differences are not great but somewhat higher than expected. In one case the difference was 1.54:1 versus 1:1.

It is interesting that adding 31" of coax resulted in noticeable changes in the last two tests.

The swr seems close enough not to worry about.  When you get below about 1.5 to 1 on the Icom, that is all you need.
Also did you change the slug on the Bird ?  Most of the time to get an accurate reading, you need to put in a slug that the full scale is about 10 times less than the one that you are using for the forward power..  That is if you put in a 100 watt slug and are showing almost 70 to 100 watts on that slug, you need to put in a 10 watt or less slug in for the reverse power.
While the Bird is a good meter to use in the field, it is not all that accurate over the full range of the slug.  If you have a 100 watt slug, it could be off 2 to 5 watts on the low end and that would make the swr show up with several tenths of differance.

Careful. I learned the hard way about this. Do NOT exceed 10 times the forward power rating of the slug for your reflected measurement. This comes straight from Bird. If your forward power exceeds 10 times the rating of the slug used for checking reflected power, you can and will damage the slug components themselves. Been there, done it. And, even at 1/10th, keep the measurement period brief.

Accuracy of the Bird 43 element is 5% of FULL SCALE, no matter what power you are measuring. If you have a 100W slug, the accuracy is plus or minus 5 watts, whether you are measuring 100 or 25 watts. Always use the lowest power slug you can without pegging for the most accurate reading. I've never seen that drastic an error, but that's what they are rated. Try to get the meter as high as possible without pegging for accuracy.

Thanks Ralph and Gary for your comments on the Bird 43 Wattmeter.

I only have the 100 Watt Slug for HF. It sounds as though my reflected power readings would not have been very accurate. The first marking on the scale represents 2 watts and I was doing my best to estimate all of the reflected power readings.

If the meter's accuracy is 5% of the full scale power, then even the 2 watt marking would not be very accurate. However, I wonder if that 5% (5 watts) really applies at the very low end.

That's great to know about the 10X maximum power rating on the Slug.

That's their point. Keep the meter as high as it will go if you want to
measure the power. Even then, you have to take reactance into account.
It is only accurate at 50 ohms resistive. I.E. dummy load.

I've experienced this one
Open the case, there's a fuse inside, toward the back.
When it's loose, you get those symptoms.
Check the fuse, make sure it's good, then re-seat the fuse in the clips.

From: Ralph Mowery
Topic: 19914  Message: 19933

Looking at the specs , this unit does not seem to be all that accurate either.  It specs 5% but does not refferance it as to the reading or full scale or what.

It shows 49.9 db of return loss, but the specs show the coupler is only rated for 30 to 40 db of directivity.  That means it shows atleast 10 db more on the display than where it can be accurate.

While I am sure the LP-100A is a nice unit, the displayed value accuracy is still not all that great.  When you have a digital radout to two decimal places, that means you need to have a percision of atleast that much if not more to be accurate.

The average ham does not need to worry all that much about the SWR anyway.  As long as it is below about 1.5 to 1 most rigs will handle this without any problems.  If greater than 1.5 to 1 then eitehr an internal or external tuner will take care of that.  Just adust the tuner for the lowest SWR and don't worry about the exect value.

For those that want a precise measurement of SWR, R, Z, etc. why don't
you get something like the LP-100A?

Re: "That's their point. Keep the meter as high as it will go if you want to measure the power."

I agree that the higher readings on a Bird Wattmeter will be more accurate. However, I really question whether 5% of the full scale reading applies at the low end.

In my case, that would mean that the 2 watt mark would be 2 watts plus or minus 5 watts. That would calculate to be -3 watts to +7 watts and those numbers just don't seem realistic.

On the positive side, my tests still seem reasonably valid. Even if the low reflected wattage readings were off in terms of the exact reflected power, one can still see the trend of the SWR versus frequency and also determine the low point.

I've experienced this one
Open the case, there's a fuse inside, toward the back.
When it's loose, you get those symptoms.
Check the fuse, make sure it's good, then re-seat the fuse in the clips.

Hi People's

Can anyone point me towards a replacement ribbon cable for my 706.
It connects the rf controls to the pcb.
It's a months wait from icom and I don't really want to hard wire.
Spacing between track connections is vy small. About 0.1-.2mm I think and 13 connections.
Overall length I'm guessing as its not with me is about 75mm(3")approx.
Many Thanks

clean the contacts between the head and the radio use a pencil eraser or
contact cleaner, if that does not do it open the radio and loosen then re
tighten ALL of the internal screws.
Contact path in this radio has been a reported problem for years. go into
the web part of this yahoo group and you can search the posted messages on
this and there is a huge amount of information there.
Also you can join the 706MIIG group

YOu may want to look at this.

http://www.n1eq.com/tech/page_03.html

I have one this hapened to twice.  Sent it off to one place and it came back in a few days and worked over a year.  Then about 6 months ago I sent it to Matt and it came back  and has been working fine.  I think it was a diode and a resistor that was replaced.  Also the circuit board needed repairing for corossion the last time.

I know N1EQ's work well. He repaired this 706 last summer about this same time when lightning got it. Did good work and he's very fair.
Well I had made the assumption my PS was good and it was--13.89 at the rig. The fuse on the PA board is good as well. Also checked and cleaned the contacts between the Mars Lander and the Mother Ship. Still no-go. Get a "click" from a internal relay(?) and then a slight "click" as it changes state again. No other signs of life. There was an electrical storm that came thru yesterday afternoon and I had disconnected both coax cables. *But *I did not disconnect the AH4 control cable. I suppose something could have gotten in on that line. My next step will be to check for the corrosion issue noted above. Might start on that tomorrow afternoon. I will update you guys on what I find. Many thanks for all the help so far!!

Hello,

I have just joined the group, so please indulge me if this topic has been hashed to death before.

I recently picked up a IC-706MkIIG used, and after going through all the setting found that the power ouput on HF SSB is only 50-60 watts.

I have made sure the power setting is set to "H", but it is only putting out about half of what it should.

I heard somewhere that ICOM no longer has parts for the 706, but I wanted to inquire who might be able to repair this radio at a reasonable cost. I'm in NOCAL.

Thanks,

Craig

How is the radio loaded? Antenna? Dummy Load? Antenna Tuner? etc.

The design reduces power output if the VSWR in the antenna system is above 1.5:1 This is to protect the finals.

How are you measuring the output power? calibrated wattmeter properly terminated in 50 ohms; or, the Po display?

We need a little more info. I suspect the radio is fine and that the VSWR is slightly high.

What's the power reading on CW or RTTY on High?? Also what's your SWR?

I noticed that unless you've got the comp set high (I tend to use an old Adonis 503) that the SSB is quite low, with high compression on it peaks up to 100w quite nicely. SWR though could be lowering the power to protect the outputs??

Thanks to all that replied to my post.

I solved the low output problem, but the cause was so unusual I thought I would share it.

I had a two prong connector I had put on the power cable going my switching power supply. The connections were nicely soldered to the wires.

Apparently, it was good enough to draw most of the power needed.. but too high a resistance to draw all that was needed. When I removed the connectors and wired it directly into the supply, the radio came up to full output.

50 years as a ham, but you are never too experienced to have a bad solder joint.

Do all you can to protect those finals. If your serial number is below 150,000 you have a final that is difficult if not impossible to source. FWIW--An excellent repair tech is N1EQ in Maine. His website is n1eq.com. He repaired my 706 last yr when I took a lightning hit. Very reasonable and fair. At the time I dealt with him he had some parts radios to get finals from.

The DC power connector on the 706 is a source of problems. The pin connections between the male (chassis) and female (power cable) get loose over time. The female connector gets spread a little over time (no pun intended) and it makes for a poor connection.

This group is a good source of information. Wish you all the best!

# 19958. IC-706MNkIIG in qrp service?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-08-09 21:46:54 UTC
From: John
Topic: 19958  Message: 19958

There semms to be no consensus regarding the MkIIG as a portable at lower power levels. I am planning a trip and would take my G along with 2 7.5 AH battieries and a charger. I will be staying in places where I will be able to charge at least 1 of the batteries almost every night, but the length of service even a low power appears to be an open question. Has anyone created a chart for the G showing usable time by battery size. Or better yet, has anyone had any experience with the G in that evironment at 5-15 W level use?

Thanks for reading.

John / WA1JG

A recent post suggested the limiting factor was the current draw while receiving. This limits the time to operate off batteries. So I guess there hasn't been an overwhelming temptation to take the radio portable because of the battery size required for extended operation. That being said, it would be better than no operation eh?!

This question keeps comming up.

Why don't you just try operating it from home one day on the batteries and reporting back here ?  It will probably take less than 3 or 4 hours to decide the battery will not last long.

As stated many times before, the receive draws over an amp with no signal and the transmitter draws several amps even with the rig at the lowest power.

the answer is the 706 was NEVER meant to be a QRP radio, it was NOT meant to operate from gel cells it wants a nice sized battery that will give it 12.4 - 12.8 all the time and 20 Amp's. if you want to work QRP or from batteries consider a Yaesu 817 or 857 something in that line that was intended for that service.

From: LARRY J. FORD
Topic: 19958  Message: 19962

Check the archives. I believe there is a consensus, and it's that the 706, in all its incarnations, is lousy at QRP, because it's just not designed for QRP operation and draws way too much current on both RX and TX, even at "low" power settings in the TX mode.

A friend of mine took his to the bottom of the Grand Canyon planning to do what you describe and got maybe 45 minutes of CW operating time before it drained the 8 AH battery so much that a portable solar panel couldn't recharge it sufficiently running all the following day.

We I operate my 706MKII "portable," it's with a 75 AH marine battery!

The next year he took a Yaesu FT-817.

# 19963. Re: [ic706] IC-706MNkIIG in qrp service?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-08-10 03:51:59 UTC
From: John
Topic: 19958  Message: 19963

Ralph,

That is where I was headed. I could not find those references, and I was guessing that I was following a well traveled path. As a starting point then, I will estimate that receive current is about 2 amps and transmit is about 4 amps. Again, I would guestimate, as a starting point, that the ratio of receive to transmit will be 2 to 1, although on a bad day, it might run at 1 to 1. So now I will test the battery-radio combination with a few expectations and I will watch the voltage as I operate to insure that the voltage does not get below 12 V where I would assume that the increase in current consumption would be really visible, and a potential problem. My target is to have a fair feeling for what I can do before I start causing problems with either the battery or the radio when I am operating in the field. Regarding the time, my plan is for only about 2 hours at most each day, I am fitting some radio in on a few other things.

Tnx es 73,

John / WA1JG

On RX, the 706 draws 1.8 A on RX "squelched" and 2.0 A on TX at "Max audio."

That's from the MKII manual.

There are some charts out there on the Web showing the (relatively high) current draw even at reduced power TX.

Jack,

I think that what you really meant is that the radio is not meant for
portable operation. Given that to reduce output to 5 watts, all that
has to be done is go into a menu and set the power to 5 watts, I find
your conclusion that the radio is not meant for QRP work somewhat of a
stretch. Well that may be true, and I might just take my 30+ yr old
Argosy and be just fine.

Larry,

Thank you for the information. It looks like my estimate on receive was close and high on transmit. I do understand that the issue of disturbing the balance between voltage and current means that as voltage drops that current increases for any given output setting. Of course this is hard on both the radio and battery I am not planning this as a QRP expedition but rather a way to have some fun when I am eating lunch or taking a break when on the road. I also have a 12 AH battery and that might be enough to give me the 2 hours a day I want if charged each evening.

In all seriousness, the battery issue might mean that the radio I use is my Argosy (1) at 5 watts instead of the 706.

NO John, Like you I have stated my thoughts! it is what I intended to say!

the 706 in any form SUCKS as a portable or QRP radio (QRP is 3 watts or less).

it works great in the mobile it is where mine has been for over 10 years with out any problems. I love my 706MKIIG in the mobile.

I'll go even further and say that it is meant for portable work if you don't want to run it a long time.

Back in the day before there were 703's and 817's and all that good stuff, you could buy a World Pack for your 706 that would hold a 7 AH gel cell, and the radio, mount an antenna on the side, and run it for an hour or two depending on your R/T ratio and desired power output (about 20 watts for me) and have a ball. I had a lot of fun doing that for a couple years before someone told me it wouldn't work :) And I'm talking halfway around the world stuff like SSB VU from the beach at ZF when the sun was coming up, with great reports.

In the long run it's hard on gel cell batteries, sure, and when the voltage drops you fm, but if all you're looking for is a little fun for an hour or two, it worked out just fine. And with today's battery technology you can stretch it more.

So ya, not designed with that in mind, but usable? Sure, especially if you already have what you need. Just don't expect what it can't deliver.

Jack,

I think that what you really meant is that the radio is not meant for portable operation. Given that to reduce output to 5 watts, all that has to be done is go into a menu and set the power to 5 watts, I find your conclusion that the radio is not meant for QRP work somewhat of a stretch. Well that may be true, and I might just take my 30+ yr old Argosy and be just fine.

on my old 706 receive current never exceeded 1.4 amps, and you'll probably find that the receive to transmit ratio most days is much easier than 1 to 1 unless all you do is call CQ :) You do really need to try what you've got and see if it works for your circumstances. 73 Scott

In a message dated 8/9/2012 10:51:58 P.M. Central Daylight Time, jh.graves@verizon.net writes:

Ralph,

That is where I was headed. I could not find those references, and I was guessing that I was following a well traveled path. As a starting point then, I will estimate that receive current is about 2 amps and transmit is about 4 amps. Again, I would guestimate, as a starting point, that the ratio of receive to transmit will be 2 to 1, although on a bad day, it might run at 1 to 1. So now I will test the battery-radio combination with a few expectations and I will watch the voltage as I operate to insure that the voltage does not get below 12 V where I would assume that the increase in current consumption would be really visible, and a potential problem. My target is to have a fair feeling for what I can do before I start causing problems with either the battery or the radio when I am operating in the field. Regarding the time, my plan is for only about 2 hours at most each day, I am fitting some radio in on a few other things.

Tnx es 73,

John / WA1JG

a commercial product is available which includes one or two of those 1 Farad type capacitors - used by the car audio fraternity, enabling the use of a 706 on gel batteries, and 15 AH with a capacitor should be sufficient to do limited operating.
The little Yaesu is a fine rig for portable purposes, but if you only have a 706 and can afford the weight of everything needed to use it, then its a viable unit to take along. I usually run mine on a 26 AH Odyssey / Genesis battery, or a switchmode power supply, as others note, it draws a few amps on transmit idle, regardless of the power setting. This could be reduced by cutting back the bias on the drivers and finals, for your trip, restoring them later

Scott,

Thanks for the encouragement. I have a built a portable 1/4 wave vertical that was designed by AD5X. The top section is the 10 ft whip from MFJ. I bunged up the loading coil and have been able to only use it on 10-20 M. Works great on those bands. I expect that It will also be fine when I finish the loading coil and can go to 30 and 40 M. It works fairly well on 20 but a couple of turns on the loading coil makes it a little cleaner. This is the portable antenna is designed by Phil Salas, AD5X. If you like to build things, you really need to take a look at his site (ad5x.com) The only addition I have made was to increase the radial count from 8 to 12. It does make it play a little nicer. Anyway I need to calibrate the length of that top section and/or how many bottom sections I need for any given band.

My plan is to take a break as I drive to ......the TENTEC flea market..... There... I said it.

As I mentioned I also have an original Argosy that can select either 5 or 50 watts with a touch of a switch. so I am not worried about not having a rig, Just that I do worry a bit a bit about taking a rig that is almost half my age out for a ride. HI.

Cheers and 73,

John / WA1JG

With my 706MkIIG receive current with the display on "dim", 12.75V input, is 1.28A. TX @ 5W CW out is 6A.

I have used my 706 with a 7A gel cell in this way on many occasions with great success. Depending on duty cycle I get somewhere between 1.5 and 2 hours of operation from a "good" 7Ah gel. If you were to put two 7Ah batteries in parallel, you would get slightly better than 2X that operating time.

> I will watch the voltage as I operate to insure that the
> voltage does not get below 12 V

At 5W out, my 706 operates fine down to 10.75V. If you only discharge to 12V, you would have very limited run time as this is only about the 30% depth of discharge point.

> I also have a 12 AH battery and that might be enough to
> give me the 2 hours a day

A 12Ah gel would likely net you somewhere between 2 and 3 hours of operation and might be easier to manage than two paralleled 7Ah units. Jump start packs are often equipped with 12Ah gels and are a convenient way to charge and transport a portable battery.

I'm sorry, there was a "typo" in what I quoted below and to which you responded (I'll blame the late night hour for my error).

What I should have posted was:

"On RX, the 706 draws 1.8 A on RX 'squelched' and 2.0 A on RX at 'Max audio'."

The TX current draw on a L(ow)Power setting is much higher than 2.0 amps as I recall from the charts I've seen (but cannot find at the present).

The 706 is a fine "portable" rig, but not necessarily a fine "QRP" rig. I have used my MKII in a portable set-up over several years for Field Day, public service events, ARES drills, etc., but it does need a pretty herky battery feeding it if you want more than a minimal amount of operating time at more than minimal power. Again, I refer you to my friend's experience in the Grand Canyon with his 706, an 8 AH battery, and portable solar recharging panel, as I posted previously.

For my "portable" deployments with the 706 described above, I take a marine battery of 65-75 AH capacity.

Sorry for the error and hope this helps.

Disagree that it SUCKS as a "portable" radio (my experience as posted proves otherwise), but it is not a good "QRP" rig, with all that the moniker "QRP" generally entails.

There are certainly more viable alternatives. I have a QRP station that includes a radio, enough battery for 24 hours of operation, antenna wire and tuner in a case that's smaller and a fraction of the weight of a 7Ah gel cell. But if you already have a 706, some batteries and a way to haul them around it's not an elegant solution but it's still a fun way to operate. The 706 brings a lot to the table in terms of band and mode capabilities, so sometimes the power and weight liability can easily be rationalized.

As I said, the 706 is a good "portable" rig, provided you understand its limitations and requirements, as I've operated with it portable many times.

It's just not designed for and does not perform "well" as a classic "QRP" rig as you describe below, but can be used as such, again provided you understand its limitations and requirements.

As I noted, my friend ditched the 706 in favor of an FT-817 for his second trip to the bottom of the Grand Canyon.

I have not operated portable except for the Field Day contest so I am speaking from limiated knowlege.  I often think that the 706 is not even that good of a rig to take portable.  By the time I take an external antenna tune with me, I often think I should just take the Icom 746pro with the built in antenna tuner.  The 746 will not tune but about a 3:1 swr, but that is usually enough for the antennas I use.

All that is assuming that plenty of power to draw from, either large batteries or AC supply.

Just a friendly comment...  It appears that "portable" and "QRP" terms are getting used back & forth in this thread.  Truly two very different meanings, and the subject line is referring to "QRP" operation.  I think it's safe to say that the 706 isn't a very good QRP rig, but is a decent portable rig.  I've used mine quite a bit as a portable with a twin-lead fed dipole and AH-4, knowing that plenty of power is required (I've never run off small battery packs).  Portable also doesn't necessarily mean small battery power... If I were looking at a true "Portable QRP Rig", I'd look at a K2 or 703, or the other models mentioned earlier.

No flaming required, just making an observation.  ;-)

I want to thank everyone who has contributed to this discussion. Although at times, words got in the way of thoughts, I do appreciate the number of people who contributed not only their thoughts but their experience as well.

Although I want to minimize the clutter in the back of the car, I am thinking about taking both the 706 and the Argosy because I don't anticipate making this trip again in the near future. Note that neither of these rigs are anything close to state of the art, although both are fun to operate in the field. I do want to operate portable and probably will limit myself to QRP (or maybe near QRP) power simply because, I don't want to lug enough batteries to go higher power and it never has been my intention to operate mobile. This will be an experiment in what can be done with minimal equipment. It is also a way to break up a fair amount of driving. We are hams after all.

The battery issue is still open but 2 7.5 AH batteries are only slightly heavier than a single 12 AH battery, so I am leaning in the direction of redundancy. One of my self imposed limitations is that whatever I take must be contained in a single milk crate and able to be lifted by me. That is still barely true.

Thank you again and look for me probably on 20 M starting about September 25.

Thanks, Cheers and 73,

John / WA1JG

Not to mention what a few milliseconds of 20A+ current draw does to a small, gel cell battery! Another reason I "go portable" with the 706 and a 70 AH marine battery.

One last chance before eBay!

Icom 706 MKII with microphone in excellent working condition and very good cosmetic shape but does have a few scratches: Reduced from $575 to $525.

OPC-581 extension cable: $35
MB63 and MB65 mounting base and bracket: $60
MB62 mobile mounting bracket: $30

PS-125 P/S: Reduced from $225 to $195
SP-20 Speaker/audio filter : Reduced from $125 to $100
SP-21 Speaker : $80

Buyer of 706 MK II gets first option on cables/mounting brackets. Buyer pays shipping from zip 22554. Please contact me direct off list. Next week any unsold items are going on eBay.

Pictures available on any item.

I recently purchased the MB 72 handle for my IC 706 Mk2G. I was under the impression that this would bolt onto the side of the rig. I have yet to figure out how to do this. There are no bolt holes that match where the handle will be attached. Even the user manual shows how to attach the handle but my Mk2G doesnt have the holes that look like the diagram. Does anyone know if there is another part that must be used or did Icom change the main unit on later Mk2G productions?

Thanks, John WB4YAL

My MkIIG, purchased new in '02, has the holes on the left-hand side, looking from the front; these are toward the front and back, so spaced much more widely than the holes (with a matching pair on the right-hand side) for attachment to the mounting bracket. I *think* (it's been a long time) that the feet came with the handle as well; does yours not have holes (or the feet already installed) on the right-hand side as well?

# 19996. Re: head unit ribbon connector

Yahoo group: ic706 (2010 — 2015)
Date: 2012-08-27 09:33:57 UTC
From: one1watt
Topic: 19939  Message: 19996

Hi Folks,
I'd just like to correct an error in my post and also to say I've now got a ribbon cable and the sets almost working 100%.

I had stated in my original post I was having to wait a month for the cable from Icom. I was actually referring to my "icom stockist (agent)" and not Icom uk.

By chance I was reading through the manual and came across Icom uk's office number and thought I'd just give them a ring to see what the situation was. I was greeted by a very helpful member of staff who offered to help as the spares man was on leave, 2 phone calls later and within half an hour, I was informed "in stock for next day delivery.....and less than a fifth of the cost quoted by the agent!
Ordered Friday and arrive in post Saturday Morning. Great Service "ICOM UK" Poor service Icom agent:(

I don't want to get all political, but I'm pretty disgusted with the agent, I'll still buy Icom because there great radio's, But use this agent in uk? Hmm, I'll leave that for you to decide.

things different in the original 706 vs MKIIG:

1.No 70cm
2. 10 watts on 2m vs 50w
3. No DSP option
4. Only 1 filter slot vs 2 filter slots
5. No backlight buttons
6. Changes bands with the TS button and main dial, vs the up/down buttons.

However, on the 706 original (the model I use) the fan is programmed to run all of the time. This is good, keeps the rig cooler.

Also, the original is less sensitive on receive with the preamp off. THis is good. The MKIIG is too sensitive even with the preamp off. That means you have to listen to a S8 noise level all of the time on HF below 20m. The 706 original has just the right amount of sensitivity with the preamp off on 30m and below. You can hear stations fine, but no extra noise on those bands. You can always turn the preamp on if necessary also.

I as a new member of the group

Can anybody tell me how the Mk 1 set performs as against the current Mk 2G

What does the original not have that the later one does?

Thanks

Mike

I have an original ICOM IC-706 ("no Mark"), and the big differences are as follows:

No AF DSP on the 706 vs. built-in AF DSP on the 706MKIIG. I use a JPS NIR-12 (external unit) with my "original" 706 to compensate.

The 706 puts out only 10 watts on 2 meters, vs. 40 (or 50) on the MKIIG.

The 706 has no 440 MHz band, the MKIIG does.

There are other differences, even between my "original" 706 and my 706MKII, but those are the major ones that come to mind right away.

Functionally, the addition of AF DSP and the addition of 440 MHz TX/RX to the MKIIG are the big differences.

# 19999. power up memory problem

Yahoo group: ic706 (2010 — 2015)
Date: 2012-08-27 15:05:09 UTC
From: ve3bv
Topic: 19999  Message: 19999

hi folks

Ive posted this before and still no clues

Heres the problem
1 when power up unit goes into CPU reset
2 The band up and down buttons don't function BUT do if needed in a different purpose ie going into a sub menu and toggleing with up/down

What I'm trying to find out is the following

Is there aterm comming from the head on the data buss thats corrupted or is there a term on the CPU that may be held HI or Low making the CPU
think it's in reset .. If so I can fool it ..If not the memory map in the CPU may be defective??

Don't feel bad folks I've hit Icom in the U.S. and Canada and they both drew a blank.

NOTE This radio was hit by lightning and at one point the Up Downs did work but I had no RF output. The rig now has been repaired but sometime in the process the UP / Down in the band action went goofy

thanks any clues would be helpful

Have you tried swapping each half (control head and main radio) with another completely different but similar 706? That's the only way you are going to determine in which half the problem is located.

Thanks Larry

Just what I needed to know

what is AF DSP?

The 10w on 2M is a shame the lack of 440 does not worry me

Not yet.
The unit is a 706 mk2 not many of this
model around. I can find lots of mk2 g version.

Tnx

The 10 watts on 2m is perfect for driving an amp, as many are set up for 10 watts input. I use mine with a mirage B108 for 75 watts or so out. Made a couple of 1400 mile plus QSOs on 2m SSB this past summer on an Eskip opening.

Michael Buckley wrote: "... what is AF DSP?"

"AF DSP" means "Audio Frequency Digital Signal Processing"

It's an earlier generation of DSP for radio (perhaps the first generation), and it does its digital "magic" of trying to reduce and/or clean-up noise at the audio stage (i.e., the frequencies that you hear, as I understand it). It works, sort of, more or less, better than nothing.

The newer and latest generation of DSP, like that employed on the ICOM IC-7200 and higher versions of ICOM rigs, use "IF DSP," which applies the digital processing at the Intermediate Frequency stage of the receiver, much earlier than the AF stage. It works much better.

Note: I am not an RF engineer, nor did I stay at a Holiday Inn Express last night, so that explanation just exhausted my knowledge of how AF DSP vs. IF DSP actually works!

I invited learned commentary, designed to further illuminate the question at hand, but mere "nit picking" is neither needed nor welcomed!

Larry J. Ford
KG4GPJ

P.S. I disagree with your comment that "...10w on 2M is a shame." That 10 watts on 2 meters will actually do more than you think. You have to remember that the original IC-706 is mid-90s technology, was a complete ground-breaking achievement to put HF/6 meters/2 meters all in one package, so some compromises had to be made. Yes, compared to what is available almost 20 years later, it does seem to have some shortcomings, with the benefit of "hindsight," which is always 20/20 or better. If you have a need for or want more than 10 watts on 2 meters, just fork over some extra $$$ for a "brick" 2-meter amp, or an IC-706MKIIG!

It is what it is.

I'm running a 706Mk0 in my truck...

2M performance isn't half bad. In fact, the 10W isn't the issue I have with out local repeater - I can hit it no problem. My biggest issue is that part of my daily drive is a trip through "QRM Ville". This is the city where they keep no insulation on power lines. Every time it rains or the humidity goes over 10%, all the power lines turn into spark gap transmitters.

At this point, the pretty nice receive function in the 706 turns against me.... (sigh)

The only thing I would like from the MkII is the 70cm capability. I've spun the dial and can hear the weather sats on 137Mhz with no problem using the vehicle antenna. I keep wondering about doing Sat work mobile. If I had 70cm, I could try it.

# 20008. Problems on transmit on the HF/VHF Transceiver IC-706

Greetings:
I am brand new to the group. My name is Richard HS0ZFQ and I was first licensed in 1958.I have had the IC-706 since about 2002, before I retired and it has been a really reliable rig.
I just got it out of the shop because on transmit ( I only operate cw ) the fan would go on. At least it sounds like a fan. And then in a couple of minutes the screen would go black and it would cut out.
Let me back up for a minute. From the IC-706 it goes directly into a LDG Z-11 Pro tuner and then down and outside to a Balun Designs UNUN and into an S-9 31 ft. vertical antenna. I am beginning to think that I have a water leak somewhere. I have checked all the wires and connections. I would like to get an idea from others who have experienced the same kind of problem. After using the706 for about 10 years I have no complaints. Any information on this problem will be highly appreciated.

Richard,

they are susceptible to earthing problems, such as loose contact with grounding wipers and straps inside the case, loose ant. connector, bad power connector. These things lead to RF instability on some frequencies.

Also the contacts of the control head to radio connection sometimes get dirty and cause random shutdowns. these can be cleaned.

There is a difference in the way some models operate the fan. This operation can change if the low speed fan control burns out. It can also be modified if you want the fan running full speed all the time.

Ralph

I have for sale 3 RFI supressing torrids which would work in your Icom 706 (or other Icom radio) setup. Two of them are the MFJ snap on square torrids. The other one is a larger, round, 2 1/2 inch diameter torrid.

I am asking $11 shipped for all three of these, and can take paypal/check/mo.

# 20013. F/S: ICOM UT-106 DSP unit (for 706MKII & MKIIG, etc.)

Yahoo group: ic706 (2010 — 2015)
Date: 2012-09-08 05:49:31 UTC
From: w9xc_radio
Topic: 20013  Message: 20013

I'm selling a (used) ICOM UT-106 DSP unit (for 718, 706MKII & MKIIG, R75, etc) - works great, with installation instructions. Price: $75.00, shipped CONUS (only).

Full details, high-resolution pictures, and payment/contact info is at:
http://w9xc.net/forsale

If interested, reply off-list (see website, or email above).

73,

-- Les, W9XC

# 20014. Icom IC 706 Mk1

Yahoo group: ic706 (2010 — 2015)
Date: 2012-09-10 15:03:36 UTC
From: g3yfo@blueyonder.co.uk
Topic: 20014  Message: 20014

Hi Everyone,
I need help in finding a GOOD copy of the service manual for the IC 706 Mk1, I have downloaded some copies from the net but they are not very clear, when you try to trace the components on the PCB, I am have a problem in finding the Transistors (Q xx) sometimes it looks like (Qxx) but in fact it's a diode (Dxx) i have been trying to repair a fault on my unit but after many days I have given until I can find a nice clear copy of the service manual, the main parts I am looking for is the PCB Components Layouts for all the various boards in the unit.

If anyone can help me out I would be very happy.

many thanks Mark (G3YFO)

# 20017. Remote mounting- how to go 350 yards?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-09-13 17:16:52 UTC
From: Mark
Topic: 20017  Message: 20017

Greetings all,

I live in a small valley with a hill leading down almost to my back yard. I have long wondered about mounting an antenna at the top but for my purposes that would be more expense than what my radio needs are (my antennas work pretty good at the bottom of the hill).

However, I have often wondered about installing my 706 at the top of the hill if I ever got into DX 2 meter or 440.

Running power to the site would be easy to do, just wondering about what is involved in a dependable link between the radio and the control head/mike/key/speaker? If there is a simple way of remotely controlling the antennas via the connection I'd be interested in learning about that too.

All helpful advice is appreciated!

Thanks!

Mark

To anyone interested,
here is a copy of the IC-706 manual that has High Resolution Pictures that you can Zoom in on. It is the BEST on available.
I'll leave the link up for a day.

It is a HUGE file, 89 megs, so if your internet is not fast, it would
appear that it was hanging up.
It takes awhile to download, even at my 35mbps speed I have here.
I can put it back up if you guys would like to try again.

I put it back up here:
http://www.n6wk.com/Icom/
It is in both Zip and PDF format.
If you have a problem downloading it in PDF, try the Zip version

# 20024. IC-706mk2g went dead

Yahoo group: ic706 (2010 — 2015)
Date: 2012-09-22 17:37:17 UTC
From: cpitcher@verizon.net
Topic: 20024  Message: 20024

Yesterday I installed my IC-706 mk2g in my car replacing my old workhorse IC-706. It worked fine and I had a couple of 10 meter QSO's from the driveway and set up all my repeater splits.

Everything worked fine until this morning when I pushed on the power switch and everything went dead. I expected to find a bad fuse, but both were OK, and the power connector is on tight.

Any ideas what happened?

Thanks,

Craig

Craig,

If the fuses are good try disconnecting the head from the body or the extension cable at both ends and clean BOTH sets of contacts on the head, body, and cable. Reconnect and try again.

Thanks Ken,

I found just the problem.

Yesterday I had my car in for repairs, and apparently the mechanic disconnected my battery cable. When he put it back my radio connections was put back on the battery, but he must have broken the solder loose on the lug so that the contact became intermittent. I have since crimped and soldered it back, and all works fine.

I would like to hook up my 706 MK2G to my Heathkit SB220 linear amp.
Is it possible to hook up directly to the 13 pin din connector Pin #8
and ground? My amp has the soft key circuit installed. I saw a circuit
on the LINKS area showing a transistor keying circuit. Can one use a
Amerirton ARB 704 Ampliifer-to-Transceiver Interface box?
Thanks and 73,

Even with the soft keying circuits, you can not hook up most amps to a 706.  The 706 does some odd voltage swings instead of just going to ground  on the keying pins like most rigs do..

I built one for my 706, but there may be some on ebay just for the 706 to key amps with.

From: LARRY J. FORD
Topic: 20027  Message: 20029

That, plus the fact the 706s (I have a 706 and a 706 MKII) have no relay jack for the key line to the amp. As has been mentioned, you have to buy or build an interface to the 13-pin DIN Accessory Port on the back and pick-up the line/pin that will key the amp.

Ameritron sells ready-made cable to interface its ARB-704 amp buffer to the 706 series, or you can build one of the several interface circuits floating around the 'Net.

Rick,

Page 6 of yhe manual gives the pin outs for the 14 pin accessory connector. Pin 3 goes from 8 vdc to <.8 vdc when transmitting [HSEND]. This is the circuit to actuate an amplifier.

Your SB-220 will overload this circuit. A buffer is required. I mentioned in my direct response that the ARB-704 is a vy good circuit. However, the ARB-704 needs to have it's connector replaced to match the 14 pin ACC connecter on the 706. Remove the RCA plug and install the male mate for the 14 pin ACC. connect the hot wire to pin 3 and the shield to pin 2.

DD, W1MCE

Hmm ... Dave, I believe that ACCESSORY PORT on the 706 takes a 13-pin DIN connector, not 14.

At least it's 13 pins on the two 706s I have.

From: Misha
Topic: 20032  Message: 20032

Hello list members,

My name is Michael AD7VV and I have been given a Icom IC-706 MK II radio with auto tuner as well. This is an upgrade radio from my current rig an old Heathkit SB1400 and I am looking forward to getting on the air with this [new] rig on my bench as soon as it arrives via UPS. I hope to learn about this radio from this list, and maybe facilitate a few QSO's from my QTH here in North Pole, Alaska. I am using an OCF dipole antenna hung up in my back yard birch tree antenna farm and a small J pole for VHF/UFH use as well. I have a PK232 for packet/pactor though I have to rewire it for the 706 rig.

I've also been looking at a cable set up from a fellow on Ebay for working PSK31 on this rig as well; if anyone on here has any advice on using the 706 for working digital modes I'd sure like to get into that arena. Can this radio connect to HRD programming?

I have an old Bencher key given to me by an Elmer many years ago and so dusting it off and getting back into CW is also something I'd be interested in doing; maybe an old dawg can relearn new tricks?

Any way I'll lurk around here and read what I can to learn about this rig and wait for UPS to send Santa in a Brown truck hi hi ...

Keep warm, and may God richly bless all.
Mike AD7VV

The 706 works quite well with a Signalink external soundcard interface for PSK-31.

Have no comments re: alternative set-ups from eBay.

What autotuner?

I also have an ICOM IC-706MKII, used mostly for field deployment (Field Day, public service events, etc.), and it's a pretty decent rig. Not the same caliber as my IC-7200, but we're talking different generations of radio technology there.

I'd recommend reading the manual, as the 706 is a "menu-heavy" rig, but with just an initial familiarization and a little practice it becomes almost second nature.

Good luck with it.

Mark II or Mark IIg? Not that it matters much, but for the benefit of others, you might note the distinction.

I'm sure there will be others who say it works fine and to go ahead with it, but since you are coming from a more robust radio, you need to consider the size of the package. The 706/7000 are very small packages that are running big package power levels. The heat generated in the radio must be dissipated. You will have lots of fun with the rig, but it will run warm on receive and hot on transmit, especially with any key-down modes like psk/rtty/etc. I would recommend a fan be used on it for psk. Suit yourself.

However, there is at least one difference between a 706 MKII and a 706 MKIIG, as the MKIIG has a 6-pin mini-DIN "DATA" port, which can be used for packet and perhaps digital connections in addition to the 13-pin DIN ACCESSORY port. The IC-706MKII has only the 13-Pin ACCESSORY port (or at least that's what my MKII has).

To all who wrote me; thank you very much. Browsing the archives has revealed a few things to be addressed when the radio arrives and the heat is one I shall endeavor to solve with a small fan on the back side. The size is one huge plus factor for me for operations in my vehicle as well as at home. The antenna tuner is [I believe] the 180 Icom auto tuner so hopefully no problems. I am going to buy the quick reference manual as well as having already started to read the factory manual in PDF format ... more later when I get home from work.
Again, thank you all very much. This radio was used very little by a relative and is in prime condition. It is the MK II version not the G model but this should not be a problem in day to day use.

# 20039. Re: Remote mounting- how to go 350 yards?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-09-26 18:06:13 UTC
From: john baker
Topic: 20017  Message: 20039

Hi Mark,

Interesting. I can understand why you'd want to do that, especially in a hilly area. If I was going that route, I would use something like the FT8800 that can cross band repeat and operate it from a HT or your icom at the shack. I use that rig in my jeep and in the shack the same way. I can walk around with the ht and get out there sooo much better. ...providing I can protect the rig from the weather.

OR

The chart I saw for coax losses for 144m/440 at 350 ft might be informative.

RG-8 (most common for HF antennas)
8.05 / 14.35 db

9913 (more expensive replacement for RG-8)
5.6 / 9.1 db

LMR-400 (more flexible and more expensive than 9913)
4.9 / 8.75 db

LMR-600 (mo better, much mo expensive)
3.33 / 4.9 db

Running an expensive coax may be tolerable on contacts and save the rig from the climate.

Something to bounce around anyways.

God bless

This is 5 years after your post, but...did you ever figure out how to desolder the 1508 source from that driver IC? I need to replace the HF driver and can't think of anything besides removing all the components off the board, heating the whole thing up to 500F and removing both MRF1508's and replacing them with new MRF1518's, presumably while the heat sink is still hot.

-Does anybody know a non-hillbilly way to desolder MRF1508 from the PA Driver Board?

-Since MRF1508 is unavailable, has anybody used MRF1518?

-Does anybody know the non-hillbilly way to re-solder that driver amp back onto the PA Driver Board heat sink?

Hi All:

I have been using my MKIIG as a remote radio for a few years and recently got it back in the shack. I have noticed that it gets warm when connected to my MFJ 1118 power outlet, which is being fed by an Alinco DM-33-MV power supply, with the power button off. Is this normal behavior? I can hear a click from the radio when I turn the supply on. Just curious, as I might throw it in the car, and wonder if it draws current when switched off?

It is normal for it to draw a small current, but I don't know how small. When mine went in for repair for another problem, it was found that a transistor (either driver or output -- I no longer remember) was leaky, resulting in a 1/2 Amp current draw, which explains why my car battery had gone flat in just a few days on one occasion. Replacing that transistor solved the problem.

BUT the older MkIIG rigs used Motorola transistors that are no longer in production. The later ones use Mitsubishi transistors on a different circuit board.

Thanks for the reply, it draws enough for it to get fairly warm, not sure if that's normal.

Something other than the 706 is the problem then. My 706 draws less than 5mA when "off". That's many times less than the self discharge rate of the battery.

I was tuning across the bands last night and on 17 meters heard a guy talking about controlling his 706 over the internet, so I waited for a gap then jumped in and asked him about it. He uses a device made by Remote Rig:

http://www.remoterig.com/wp/

And you can use it with a couple of wireless routers so at this point in time this looks like the best option to do this. The equipment isn't cheap but as I just commented in an email to a member of this group it would be cheaper that 1,000 feet of 9913.

# 20048. IC-706 original no audio

I had a similar problem.

Are the symptoms the same on all bands?

Do you have access to a signal generator? With the preamp on, a 50 microvolt signal should read around 20 dB over S9.

It is likely that there is something wrong in the area of the preamp switching. If so, soldering of surface mount components will likely be required to fix it. If you can't do this, google icom 706 repair. There is a guy that works on most icom radios including the 706. He was very helpful to me even though I did not end up sending him my radio. I tried to pay him for his help, but he didn't respond to my query about that. My radio had a damaged capacitor that was affecting the circuit in that area. I had audio, but it was very low level.

Is this something different for you?

The 706 and 706 MKII were well known to be brain dead and not much use without the pre-amp on all the time. I've experienced it with several rigs, so from what I've heard and experienced, what you describe is normal.

That was not my experience with the MKII, it was just about the right sensitivity with the preamp off. I find that the 706 original is about right in sensitivity with the preamp off on 30m and below, and is rather deaf without the preamp on 15m and above. 17/20m are kind of in between.

That's the darndest thing... I've had a few and played with a few, all deaf. I researched it at the time, mid-90's, early 2000's, this was quite the norm. I used it to my advantage in RF cesspools like big cities. Maybe there was a design change at some point?

I can HIGHLY recommend Matt at SARS. He did an excellent job at a very fair price in fixing MY screw-ups on a 706MKIIG. Prior to that, he fixed another 706MKIIG for a priest friend of mine, Father John HH6JH in Haiti, that had been used early and often in relief efforts in that country after the earthquake and cholera epidemic, and he did the work pro bono and even paid the return shipping.

Great guy and excellent technician.

Thu Oct 4, 2012 8:42 pm (PDT) . Posted by: "Mark" m62065 <m62065@...?subject=Re%3A%20Remote%20mounting-%20how%20to%20go%20350%20yards%3F>
I was tuning across the bands last night and on 17 meters heard a guy talking about controlling his 706 over the internet, so I waited for a gap then jumped in and asked him about it. He uses a device made by Remote Rig:

http://www.remoteri**g.com/wp/ <http://www.remoterig.com/wp/>

And you can use it with a couple of wireless routers so at this point in time this looks like the best option to do this. The equipment isn't cheap but as I just commented in an email to a member of this group it would be cheaper that 1,000 feet of 9913.

# 20067. CI-V Output

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-09 18:30:53 UTC
From: ltodd3
Topic: 20067  Message: 20067

I recently sold the IC-706MKIIG I had in my truck, which I was using with a Tarheel 200 screwdriver antenna. The antenna and radio worked perfectly. I have since taken the IC-706MKIIG from the shack and put it in the truck, but can't seem to get it to activate the Turbo Tuner for the screwdriver antenna. Nothing has changed on the truck except the radio. I reset the radio to the default settings, still nothing when I press the tuner button. The red lite does comes on briefly then goes out. Anyone ever had this problem?

# 20069. Disabled antenna socket on 706MkII

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-09 22:15:15 UTC
From: Ray
Topic: 20069  Message: 20069

Hi Group,

My 706MkII (NOT G) is working flawlessly but the antenna sockets appear to be disabled from 60 to 144MHz and from 148MHz up. My manual has a WFM sensitivity listing for the 88-108MHz range but the antennas are disabled across this band.

I would like to Rx in the 60-144MHz part of the spectrum.

Is there a trick that I do not know, do I have a deficiency between my right and left ears, do I need to remove a diode or two, does my rig have a problem or am I asking the impossible ?

Any help would be appreciated.

Ray

# 20070. Cable for Packet Modem/TNC

The "smart aleck" answer would be "One that works!"

Seriously, probably need to use the 13-pin DIN ACCESSORY PORT on the rear of the MKII (I have one) for the best connection to the KPC3+, so I'd recommend going to the BUXCOMM website, and pick out what you need:
http://www.packetradio.com/catalog/index.php?main_page=index&cPath=4

Unless you're going to "home brew" a cable. I have a 706 MKII that I intend to connect to the VHF port on a Kantronics KAM+ for local packet connections to a VHF RMS Express/Winlink RMS server, and I'm using the 13-pin DIN ACCESSORY Port, rather than the Mic Jack, which is the other option.

The VHF Port you refer to is the DB9 Radio Port 2?

Which TNC are you asking about the KAM+ (actually, a Kantronics All-Mode, upgraded to emulate a KAM+) or the KPC3+?

From: Misha
Topic: 20067  Message: 20076

Fellow list members; my IC706 MKII with the AT-180 auto tuner has arrived today via FedEx .... I've printed out the manual, made connections and am going to let it warm up and after dinner will try to see if it'll make sense out of the atmospherics going on up here in Alaska .... now off to dinner ...
Keep warm all, and God bless.

# 20083. MKIIG NO RX, TX after warmup reference loop 0.13V on pars of HF bands

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-18 19:26:58 UTC
From: Edwin-
Topic: 20083  Message: 20083

Hello,

The strangest thing happens wit a 706MKIIG

The is NO TX and RX on pars of HF and low-VHF bands after "warmup".

Only parts of bands functional, approx:

1.3 - 2.5
4.49 - 6.00
7.69 - 9.00
10.88 - 12.5
14.075 - 15.5
17.27 - 19.0
20.47 - 22.0
23.67 - 25.5
26.86 - 28.5
30.06 - 32.0
33.25 - 35.0
36.45 - 38.5
39.64 - 41.5
42.84 - 45.0
46.04 - 48.0
49.23 - 51.5
52.43 - 54.5
55.62 - 58.0
58.82 - 61.0
62.10 - 65.0
65.21 - 68.0
68.41 - 71.0
71.60 - 74.0
74.80 - 87.0
87.58 - 97.0
97.17 - 100.0
100.35 - 113.0
V and UHF functional
113.14 - 200.0
200.00 - 470.00

On parts of bands outside of table above. Reference loop VCO volatege disappears. (0.13V)

Before warmup all frequencies functional.

VCO volatges have been checked according the the service manual. (Reference loop , and mainloop 1,2,3)

Anyone any ideas where to look for this fault? It already took sever hours and a can of cold spray, but the error just doe not come up.

Kind regards,

Edwin PE1PWF

# 20084. parts layout for 706mk2 display board

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-18 20:27:39 UTC
From: ve3bv
Topic: 20084  Message: 20084

after numerous attempts to repair my 706mk2, I was lucky to find a tech support rep at Icom that has led me to the possible problem.

What I need is to know the location of r25 on the display brd.

*****note ***** the 706mk2 is layed out different then the mk2g

I have a copy of the service manual but its hard to read some parts.

any info would be appreciated

have you considered calling Icom back and asking them to tell you where?
they are normally very helpful like that.

# 20086. RF output power high

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-19 13:23:01 UTC
From: Robert
Topic: 20086  Message: 20086

I have an IC706mk2g that puts out 150 watts on all HF bands. The power was measured with a bird wattmeter into a 50 ohm load. Also the internal power meter only reads 50 watts and the SWR indicator does not work. The internal HF power control has no effect. The power can be reduced by the front panel control but to get it to 100 watts I need to reduce the dial to 2 which originally was about 20 watts. I tried the Set Mode procedure in the service manual which had no effect. Has anyone experienced this problem? Thank You.

A guess here but have you tried a cpu reset? Something is certainly over the top here. I've never heard of 150 w out on any 706. I have a G model as well, have never seen over 100-110 into a good meter and load (13.8vdc). I would think you would be in danger of cooking something if you let it push that much out for very long. (if not already) My light bulb doesn't burn very bright these days--sorry I can't be of much help.

706s are notorious for "leading edge power spikes" that can hit 150+ watts, but that is merely a peak output momentarily, which then falls off to rated output.

Unless that rig has been "tweaked" with a Golden Screwdriver, it would not sustain such power output levels.

The question was asked if it was new or used. My question, if it was used, has the CB/MARS mod been done?? OH oh....typo....that should read CAP/MARS. Certainly does sound like the golden screwdriver to me.
How long will it last is a question for someone else.

# 20091. Re: [ic706] Re: RF output power high

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-22 14:17:48 UTC
From: LARRY J. FORD
Topic: 20086  Message: 20091

I also asked the question of whether it was bought new or used. If used, I agree that unless a component that regulates output power has changed value, it certainly sounds like someone has been using a Golden Screwdriver.

Perhaps the original PA transistors have been swapped out for higher output transistors, if that is possible, but the question is how long before something else is blown in the process of sustaining 50% over rated high power?

I have a 706MKII and a 7200, both of which have had the MARS mod done, but neither put out over rated power except for the traditional ICOM "leading edge power spike" (although the ICOM engineers seem to have toned it down quite a bit in the 7200).

From: Robert Roman
Topic: 20086  Message: 20092

The radio was purchased new and has never been modified in any way. It has been trouble free for many years. The RF power output has always been 100 watts, after a recient special event I noticed the internal power meter reading high and put a bird wattmeter and dummy load on the output it is a good solid 150 watts. I assume something was damaged during the special event but have not been able to isolate the component yet.  Thanks for your comments.

# 20094. Re: [ic706] Re: RF output power high

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-22 19:52:39 UTC
From: Wayne Bowyer
Topic: 20086  Message: 20094

I find it a bit sad that some hams are the same regardless of the forum. We are too quick to lay blame on the "golden screwdriver". So what? And the "golden screwdriver" always references derogatorily someone from the CB ranks. Again so what?? I've been a ham since 1978 and I was a CB'er for near 10 yrs prior to that. I imagine a darn big percentage of hams came from cb radio. I see the "holier than thou" attitude so very much on QRZ. Instead of making unfounded assumptions we could possibly ask more questions and honestly try to help the OP out?

From: LARRY J. FORD
Topic: 20086  Message: 20095

You're entitled to your opinion, but your opinion does not necessarily equate to a "fact."

You apparently ignore the "IF" in my statement below. No assumption was made, merely questions raised.

The operator explained that no modifications have been made, which changes the focus of the inquiry, as I stated below, to whether " ... a component that regulates output power has changed value ... ."

How are you helping by casting aspersions on other hams for merely speculating as to causes?

Topic: 20086  Message: 20096

I very rarly reply to this group, but always read each "post" with interest
I would like to say well done to you Wayne,
It's the same the World over,I have had comments in the past when I was a UK foundation licence holder
m3  (English)  call and 10 watts max output, and limited frequencies available back in 2003

I still hear it now a days on the bands, with m6 (next generation m3's) calls
Why not cant you experienced guys , help /encourage new callsigns  with advice etc etc , where ever they are in the World

IT'S JUST A HOBBY!  (although the best hobby in the World) who else can speak to the space station , apart from
goverment agencies?

Andy
m0 HLT
(FULL English call) since 2005

Bob,
What is the ALC meter showing in the rig? Sounds to me like something possibly failed in the ALC circuitry...

The radio was purchased new and has never been modified in any way. It has been trouble free for many years. The RF power output has always been 100 watts, after a recient special event I noticed the internal power meter reading high and put a bird wattmeter and dummy load on the output it is a good solid 150 watts. I assume something was damaged during the special event but have not been able to isolate the component yet.  Thanks for your comments.

I also asked the question of whether it was bought new or used. If used, I agree that unless a component that regulates output power has changed value, it certainly sounds like someone has been using a Golden Screwdriver.

Perhaps the original PA transistors have been swapped out for higher output transistors, if that is possible, but the question is how long before something else is blown in the process of sustaining 50% over rated high power?

I have a 706MKII and a 7200, both of which have had the MARS mod done, but neither put out over rated power except for the traditional ICOM "leading edge power spike" (although the ICOM engineers seem to have toned it down quite a bit in the 7200).

From: Wayne Bowyer
Topic: 20086  Message: 20098

Larry I wasn't referring to you when I mentioned the golden screwdriver remark. Another had raised the CB/MARS--CAP/MARS possibility. I offer my apology if you were offended. But I wasn't referring to you. All I'm interested in doing is helping the OP get his problem solved.

I haven't ignored anything you have said. You've offered more help than anyone.

Bob,
What is the ALC meter showing in the rig? Sounds to me like something possibly failed in the ALC circuitry...

The radio was purchased new and has never been modified in any way. It has been trouble free for many years. The RF power output has always been 100 watts, after a recient special event I noticed the internal power meter reading high and put a bird wattmeter and dummy load on the output it is a good solid 150 watts. I assume something was damaged during the special event but have not been able to isolate the component yet. Thanks for your comments.

I also asked the question of whether it was bought new or used. If used, I agree that unless a component that regulates output power has changed value, it certainly sounds like someone has been using a Golden Screwdriver.

Perhaps the original PA transistors have been swapped out for higher output transistors, if that is possible, but the question is how long before something else is blown in the process of sustaining 50% over rated high power?

I have a 706MKII and a 7200, both of which have had the MARS mod done, but neither put out over rated power except for the traditional ICOM "leading edge power spike" (although the ICOM engineers seem to have toned it down quite a

bit in the 7200).

# 20101. Icom 706 and possible relay problem-advice

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-25 22:23:27 UTC
From: John G.
Topic: 20101  Message: 20101

I have an Icom 706 original which I picked up around 19 month ago and really like it. I have noticed for the past few months that the receive seems to drop at times on certain bands-it started on 12m and now occurs on 15m as well. If you click the key or mic to quickly put it into transmit the receive comes back. To me this sounds like a dirty relay or one that is going bad, but it does seem to not be as bad after the rig has been on a while and probably heated up. It doesn't seem to affect 17m or below, or 10/6/2m either.

Any ideas as to what might be going on and how much it would cost to fix if necessary?

G'dday John,
I have had a 706 original from new.
A number of years ago I had similar problems. For me it was the TR relay which has a plastic lid you can pop off to clean the relay contacts with a slip of paper. That as rough as I would use. No abraisives etc. Perhaps a little alcohol. Its quite small. The cover pops back on.
As I recall the band pass filter relays are sealed. Much harder to remove/replace. They might come good with a bit more use.

I have noticed for the past few months that the receive seems to drop at times on certain bands-it started on 12m and now occurs on 15m as well. If you click the key or mic to quickly put it into transmit the receive comes back. To me this sounds like a dirty relay or one that is going bad, but it does seem to not be as bad after the rig has been on a while and probably heated up. It doesn't seem to affect 17m or below, or 10/6/2m either.

Thanks Andrew will check into that. Is the relay on the top or bottom of the rig?

G'dday John,
I have had a 706 original from new.
A number of years ago I had similar problems. For me it was the TR relay which has a plastic lid you can pop off to clean the relay contacts with a slip of paper. That as rough as I would use. No abraisives etc. Perhaps a little alcohol. Its quite small. The cover pops back on.
As I recall the band pass filter relays are sealed. Much harder to remove/replace. They might come good with a bit more use.
Andrew

# 20104. Turns off on transmit, faulty connector?

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-26 15:08:49 UTC
From: Mark
Topic: 20104  Message: 20104

Hi all,

I'm being lazy here, so please bear with me...

My radio will every once in a blue moon shut down and turn off while transmitting. It comes back on (usually instantly) when I wiggle the connector, so I was just thinking that the connector had a poor contact. About a week ago it finally did it when I was being less tolerant, so I cleaned the connector surfaces with a toothpick and some polishing compound, and slightly compressed the sleeves in the plug to give a better contact. No issues at all until last night, when I was working a pileup with a Ukranian station on 40M and when he finally answers my call and then I key down, the radio decides to turn off, argh argh argh!

Anyway, I am going to replace the connector completely and open up the radio to look inside at the other side of the power plug for good measure, but figured it would not hurt to ask here in case this has occurred to others as well and there is some well known issue. I did a search and nothing came up but that can be a result of my limited search-fu as well.

Thanks all!

Mark

Could be RFI. You could prove this by testing your transmit into a dummy load. If it's a DC problem, it will recur. If it's RFI it will only happen with the antenna connected.

Hi Mark,

It sounds like the same problem we had with our Mk2, we suspected it was the Power Connector and since I had a 4 way automotive type connector that was physically a similar size and rated at 30A per pin, I replaced it with that rather that spend extra money on something I wasn't sure was at fault. After doing that we haven't had the problem occur since.

I came to the conclusion that with age the pins/sockets lose their springyness and probably start to break contact as they warm up slightly.

73,
Colin
M0XSD.

# 20109. 4 Sale: IC 706 MK2

Yahoo group: ic706 (2010 — 2015)
Date: 2012-10-26 21:00:23 UTC
From: John Dolan
Topic: 20109  Message: 20109

I own an Icom IC- 706 Mk2 that has the UT-
106 DSP unit installed as well as the FL-232
300 HZ CW and the FL-223 1.9 kHz SSB filter.
The rig has not been mobile. It is 9.5/10 in
looks and 10/10 operationally. I have an LDG
AT-100 Pro II Autotuner that is part of the
deal. This unit is in great shape and includes
the power cable, tuner cable to the IC 706,
manual and original box. The tuner cable
allows one button tuning from the front
panel of the IC 706. Lastly, I have the
SignalLink USB sound card interface. This unit
comes with usb cable to PC and the cable to
the IC-706. Also included is the original box.
The IC 706 comes with hand mike, power
cable , OPC-581 Front Panel Separation Cable
11 ft, the MB-63 Face mounting bracket and
the original manual, minus the original box.
NON-Smoking HAMSHACK The reason I am
looking to sell is I want to have a "tabletop"
rig. Would like to sell all items as a
set.
All gear for $800 plus shipping CONUS only. You choose method, I will get a quote. PayPal
plus the 3% Or USPS Money order. Pictures
Via email to serious party. Thank you and 73, John WB4YAL

The connector is well known to be a POS. Get a higher quality Molex, the original is a molex "style", and replace it, or remove it entirely and hard wire it with no connector at all. I put a fiberglass plate in the connector hole and used 6-32 stainless steel studs to bolt the wires on with locking nuts. Problem solved.

Hello group,

I have searched for information to find out if a Icom IC706 Mk1 is suitable for use on 5MHz, but all the information I've found so far is related to the MK2G.

Does anyone know if there is a LPF issue with the MK1 taking into account the age of the radio and that they may not be suitable for use on 5MHz?

Many thanks,
Mike G1ZRN.

I have an IC-706MKII that has been modified to work on 60 meters on the 5 "channels" allowed in the US and it works just fine.

Why would the MKII be different from the "original" 706 in that respect?

Hi Larry,

Thanks for the reply.

There is a big difference between the Mk1, 2 & 2G, basically they look similar but that's where it ends as they are totally different inside.

Cheers,
Mike G1ZRN.

Hello all,

I was using an old Heath 12v power supply (HP-1175) and the unit started to act flacky. Smelled a phenolic odor and it stopped working. Found the PS output to be 26V DC unloaded!!

Connected it to a known good 12v supply and it now seems to rx all ok on all bands. But on tx, it has no rf out, but the RF power can be varied on the indicator from "L to H" but nothing out on the Bird to dummy load. All meter readings on tx go full scale (bar indicator) on ptt.

Spoke to factory tech (Mi) and he thinks that driver and finals are probably gone, plus. (est - $450 to $500)!! More than 50% of value.

Have not opened it up yet! Any ideas, opinions or suggestions are welcomed. Thanks,

Bob - K2CRR

I rebuilt a complete TX on a 706 and the cost is right on.. The finals on HF and VHF I got from RFparts.
One question you say when you PTT the meter goes full scale. Does the unit draw full current 15 amps + if so look around the filter relay drivers..

bruce
ve3bv

if you want to part with the unit for parts if it looks too costly to repair let me know I'm looking for a spare head

Something similar happened to a ham friend and his Yaesu FT-950 when an MFJ power supply went "over-voltage." Fortunately, my friend's FT-950 had a over-voltage protection circuit of some sort (not a crowbar circuit) that got fried instead of the finals. Still, it had to go back to the Yaesu service center, and it cost him roughly $200.00 to get it fixed, but it could have been worse.

If the 706 has something similar, then it may not be quite as bad as Matt has estimated.

Shortly after that incident, my friend and I had a "soldering party" and built-up 4 external "crowbar" over-voltage protection kits, which now sit between our rigs and the respective power supplies!

Bob, is it just hf?
I lost a final on VHF/UHF for unknown reasons, maybe Texas summer heat.
I sort of determined it was the final because although it wouldn't wiggle a 4w meter, it would key the repeater and run echolink from a quarter mile away.

I'm not home so I don't know about your serial number but pop the top and determine if they are Motorola or Mittsubishi. Hopefully they are Mittsubishi. They used to be available for $30 from rf parts.
If Motorola that's bad news.
The $450 may be for A Motorola board.
I'd think that pretty high for a Mittsubishi repair.
If your in the Northeast I'd check with Matt in Michigan at Saris I think or there is a guy in New York State. I'd have to do some digging.

Is it only on hf ? VHF works or not?

Check the RX antenna jumper on the back. Could be a bad cable, or if the connection has been stressed, the RCA connector solder joint inside the radio may have failed.

Date: 2012-10-31 16:11:39 UTC
From: Chris L.
Topic: 18892  Message: 20124

I am having the same issue with mine as well. Only VHF FM is affected. VHF ssb and AM are fine. The noise will start up low and then progress louder. I have checked all connection, switched antenna's and tried it both in the car and home. After a few minutes there will be a loud crackle and then the rx/tx will come back to normal and then the noise will start up again in a few minutes.

Anyone have any idea's?

Hello,

Can anyone help I have a digimode interface connected to the Acc port on my MkII, however the PTT is connected to Pin3 HSEND but I also want to use the interface on VHF, can I connect the PTT wire to Pin 3 (HSEND)and pin 7(VSEND)to acheive this ???

Precisely my issue. Found out that's a somewhat common problem with I guess early G models. Mike Nadeau at http://www.n1eq.com/ is who you need to talk to. He has worked on my 706 twice to repair other issues of my my own doing.

I think it has to do with some flaky trimmer caps in the rx. He does good work and is very reasonable.

As this is just an FM only problem, look for an adjustment for the FM VCO.  The VCO may be on the verge of locking and unlocking.  Could be an adjustment or maybe the capacitor or pot (forgot which one, but thinking pot) just needs to be turned up and down a few times to get rid of some dirt/oxidation on it.

On the Mk2 there is no option. What you're thinking of is the Mk2G where
Intial menu 30 give you the following options

30 VSEND SEL (ACC socket output)
?on?: VSEND is for 144/430 MHz; HSEND is for
the HF/50 MHz
?U only?: VSEND is for 430 MHz; HSEND is for
HF/50/144 MHz
?oFF?: VSEND is not used; HSEND is for all
bands.

# 20133. Microphone for SSB

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-04 12:04:45 UTC
From: m6avp
Topic: 20133  Message: 20133

I have just recently upgraded to an Icom IC706 Mk1 and was wondering what the best budget replacement microphone is for SSB.
I have been told that because I am too softly spoken I need to shout! Something that doesn't feel natural when speaking to someone so I don't make many contacts.
I have been looking at the possiblity of using a dynamic microphone with a pre-amp as discussed by M0MTJ on his Website. Howvere, I dont want to damage the radio by doing something wrong!
Any help and advice would be appreciated.
Thank you.

# 20134. 706MKIIG AH-4 Issue

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-04 16:39:45 UTC
From: al7px
Topic: 20134  Message: 20134

I just found this forum today and thought I would throw out something since you guys have probably seen almost everything with this radio. I use the radio with the AH-4 tuner and have a issue tuning the upper bands when the radio is first turned on. Most of the time 30,40,80 meters tune right up but the higher bands (10,15,20 meters) will not. After a 15-30 minute period with the radio powered the upper bands tune fine.
I thought it was a issue with the tuner and had Icom check it out and they couldn't find any defects. I even asked them to do the cold test before sending it back to me. It passed. The antenna I am using is a 23 foot vertical. I also tried a dummy load and both have the same results. The radio has very little use and has never been mobile. Tuner sat in my closet for 5 year up until this past summer.
Any ideas would be greatly appreciated.

I've often heard that the very best all around mic for the 706 is the factory handheld mike. Do you have the mic gain up sufficiently? I run mine around 7 to 8 (advised by a long time Icom user).

I have a good amount of low frequencies in my voice and had a similar problem. On my Mk2G I set the mic at 2, but with the compressor ON. The 2 setting seems fine for FM, the the gain provided by the compressor is great for SSB (uhf to hf). Simple to try so give it a trial period.

What are you using now? The "standard" ICOM HM-103 hand mic, which came with the "original" IC-706 (no MK) and the IC-706MKII? (It may have been factory standard with the IC-706MKIIG as well, but I don't have one of those).

From what I understand, the HM-103 has a Heil element (electret) in it that was designed to work with the 706, and probably works as well as another other hand mic out there, although I believe there are a couple of "tweaks" some folks have done. It seems to work well with my IC-706 and my IC-706MKII, which I use in the field and mobile.

However, I've found that the Heil Traveler headset/mic combination designed for the 706 works very well, and the Heil mic element in the Traveler probably more optimized for the 706. I have two Heil Travelers (both old-style and new style) and get good audio reports, either on the 706s or with my IC-7200 (just have to adjust the mic gain correctly when switching the Traveler from one rig to another.)

Don't know what "budget" means to you, but Heil Travelers can be had for $40-60 USD used or <$100 USD new.

Larry J. Ford
KG4GPJ

P.S. Before anyone comments, "Yes," I have tried the set-up for the 706 sold by W2ENY on eBay and other ham sites purportedly allowing a common computer headset/mic combo to be used with the 706. Yes, it will "work," no, it will not work very well, audio sounds low and muffled, according to reports I have received, and it does not work with ALL computer headsets. It does work with the Labtec headset he sells with his cables (more valuable than the headset itself, IMHO), but I get poor audio reports.

From: LARRY J. FORD
Topic: 20134  Message: 20138

What radio are you trying to use?

Wasn't this discussed on the ICOM Tuner forum?

If the tuner checked-out, then my bet is that the radio you're using (an IC-746 judging from your e-mail address) has an issue with a component changing value with temp changes in the rig. The ICOM AH-4 (I've had a couple and still have an AH-4 and an AH-2) is controlled for tuning purposes by the microprocessor within the ICOM radios designed to work with the tuner.

The component that's changing value (my guess) may be within the microprocessor (probably the worst outcome). If not the microprocessor, then I have no clue where it might be.

Send the radio in to an ICOM Service Center may be the action needed at this point. I've had great success with Matt Adrian at ICOM Service Center - Michigan (SAR Technical Services, Inc.)

Communication studies by the USA military confirm that moderate Compression
increases "communications ability" of transmitted SSB. Turn ON compression.
If possible set it at about 6dB.

# 20140. Re: [ic706] Microphone for SSB

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-05 19:23:26 UTC
From: Joe Isabella
Topic: 20133  Message: 20140

I had very good results with the stock mic and the DTMF mic. The 706 is a different animal than the MKIIG, in a lot of ways including the mic gain.  I had to tweak mine so that for FM repeater use, I ran with the compressor OFF, but for SSB, I ran with the compressor ON.  What I did was simple -- I got on my local 2m repeater and asked a friend to help me out.  I ended up with the mic gain around 8, I believe.  Then I got on HF SSB and turned ON the compressor, and tweaked it using the adjustment on the side until I got a little deflection on the ALC meter.  The down side it remembering to switch it back & forth when you change modes -- you'll be VERY loud on FM with the Compressor on, and with that rig, you have to switch to SSB to get the softkey back to turn it off...  LOL

Communication studies by the USA military confirm that moderate Compression
increases "communications ability" of transmitted SSB.  Turn ON compression.
If possible set it at about 6dB.

Thank you for the comments.
The mic gain is set to 6 with the compressor switched off. I have not been able to get a good contact on SSB so don't know how good or bad it is. I have based my conclusions on the fact that when using FM to tune the antenna I get a full 10 Watts on the SWR/Power meter. However, when switching to SSB I only get around 2 Watts.
I will keep trying with the supplied mic for now.

Thank you for the comments.
Yes I am using the supplied HM-103 mic.
I have had a look for a used Heil Traveler headset but there are none in the UK. A price of around £40 the leads is my meaning of budget.
I will keep trying with the supplied mic for now and keep an eye out for the headset.

# 20144. Re: [ic706] Re: Microphone for SSB

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-05 23:51:38 UTC
From: LARRY J. FORD
Topic: 20133  Message: 20144

From the Heil Sound website: (www.heilsound.com)

(Note that the original IC-706 falls into the "low-gain" group of early ICOM rigs)

"All Things iCOM
Microphone Basics

Icom HF rigs fall into two distinct categories, as far as microphone interfacing is concerned: these are the "low-gain" models (earlier designs like the IC-735/745/751/761/765/781, non-Pro 746/756, and early IC-706), and the "modern" designs (which include the 746Pro, 756Pro series, IC-7700/7800, IC-7000, and the IC-706MkIIG).

To accommodate the low-gain Icom designs, Heil Sound developed a high-quality condenser element, called the "iC" in our products designations, that provides the optimum frequency response, impedance, and (most importantly) sufficient gain to drive these earlier rigs. The "iC" element also works tremendously well with the "modern" types of Icom rigs, making it an ideal all-around microphone. This element is found in products including the iCM base station microphone, the Handi Mic iC, the Pro Set iC, Pro Set Quiet Phones iC, Pro Set Plus iC, BM-10 iC, the Traveler series, and the Classic iC."

Note that the Heil Traveler series is recommended for the early 706.

Date: 2012-11-05 17:00:52 UTC
From: Bookcollector
Topic: 20133  Message: 20145

I ran a whole contest weekend last year with my mike gain set at 2 and the compressor on (mkIIg). The next week I got a new power meter and found I was only modulating up to between 5 and 10 watts out.

With the gain set at 8, I register 60-70 watts on the meter with little ALC action and had several good reports on my audio.

# 20147. Re: 706MKIIG AH-4 Issue

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-10 16:55:02 UTC
From: al7px
Topic: 20134  Message: 20147

I thought I give a update on my problem dealing with the 706MK2G and AH-4 dealing with cold temps. I received the tuner back from Icom (WA) with a clean bill of health this past week. They checked it with a Icom 7000 radio. Well, I have a friend with a 7000 and AH-4. I burrowed his AH-4 one day to try on my 706 and it worked perfect, even after the 706MK2G being cold soaked for close to 30 minutes in 25 degree temps. So, the next thing was to see if my AH-4 would work ok with his 7000 and it worked perfectly. Although his radio wasn't really cold (20-30F) it was just turned on for the test.
I changed out my short coax going to the tuner (2 feet) and used his longer stock length that comes with the tuner and found my 706 tuned better (quicker time tuning upper bands) even after being cold. I have since replaced my coax cable and just coiled excess into a choke and the radio tune function work considerably better even after being cold or first turned on. All bands tune within 10-15 minutes after the radio is turned on. By the way, all tuning was done with a dummy load. Go figure? But I can live with it now.

# 20148. CTCSS & Repeaters

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-10 16:59:59 UTC
From: mw1lcr
Topic: 20148  Message: 20148

Hi all

I have just bought a 706 MKII G (DSP) and am having difficulty setting up memories & repeaters & tones.

I want to get to the point where I have 10 - 15 repetaers set up in the memories so that I can just flip between them...

I have a number of repeaters in range, using a mixture of different CTCSS tones to gain access.

Whenever I set up a memory channel with say, 71.9 CTCSS, it will work, then if program another channel with 110,9 that will work, but the 71,9 memory won't!

I have a copy of IC706_BKT running and that has helped program the memories, but it seems the 706 just wants to do its own thing!

Any ideas hep ?

Cheers

Adrian MW1LCR

I haven't used the 706 on FM, but it sounds like you aren't saving the memory after putting the tone on it.

I recall the CIV protocol on the 706 doesn't support writing tones to memory.

That is correct. all tone info has to be entered manually then stored.

Hi all...

im looking for a PLL unit for an ICOM IC-706 (MK1). icom does not manufacture these anymore... can anyone help me get one?

thanks

# 20153. 706 MKII power output

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-13 20:06:38 UTC
From: ke5dpe
Topic: 20153  Message: 20153

My 706 MKII is only showing approx 15-20 watt output across the bands.
DID a reset on the radio. After tuning the antenna and trying to adjust the power up, It increases from L to 3 (up to about 20 watts max) but no further increase up to H. Anyone have any suggestions on what to try or should I find a tech?

# 20154. Re: [ic706] 706 MKII power output

Have you checked the supply voltage to the rig?

If it's 13.8 VDC, or close, then my best guess is that you may have "soft" PA transistors.

If it needs to go to repair shop, I recommend Matt Adrian at SAR Technical Services in Michigan, an independent ICOM Approved Service Center. I and many others have had very good dealings with Matt, who provides good, prompt service at reasonable prices. I have had him work on my 706s as well as my 7200.

Check out his eHam ratings.

From: Ralph Mowery
Topic: 20153  Message: 20155

If the SWR of the antenna is ok, check the DC power contacts on the radio to make sure the full voltage is reaching the rig.  You might also want to check several bands.  It could be the filter circuit on one band is not working correctly.

Other than that, it looks like a trip to the repair man.

I sent a 706 off to Matt about a year ago now.  He repaired it and the cost was very reasonable.  He seems to stay busy so it may take him a couple of weeks to do the job, but it will be done right.
That is the way the good repair men are, booked up all the time.

Reading between 13.8-14.0 v

Output seems OK on 2meters but thats the only one.
I was afraid it might be the finals. I guess I'll give SAR a call.

Thanks.

It is worth checking the Supply out of the Tuner connector on Tx, I had
a problem with the Rigs Power Connector and the supply to the Tuner was
dropping badly (causing me tuning issues as well as low power).

73,

# 20165. Fwd: Re: [ic706] AH-4

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-15 03:26:38 UTC
From: LARRY J. FORD
Topic: 20165  Message: 20165

Yes, someone has really tried to use the AH-4 with non-ICOM rigs.

It can work with an interface between the AH-4 and the TS-870 (I used to have an 870 and sold it to buy an IC-7200).

There are a number of interface plans on the Internet.

You can find one example here:

http://home.comcast.net/~hamlakemn/Hamoperator/AH-4_Universal_Interface_files/ah4-manual-5.pdf
-
I believe this interface uses an RS-232 port to key the AH-4 and the TS-870 does have an RS-232 port also. So, that's one possibility.

You may be able to use the Accessory Port on the TS-870, also.

Here's another example:
http://home.ix.netcom.com/~hmlong/#Ken%20Short%20Discussion

So it is possible, looks like it depends on how bad you want to do it!

Good luck.

# 20169. External S-Meter

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-19 03:56:30 UTC
From: wd0ss
Topic: 20169  Message: 20169

Hello group,

I've come up with a way to connect an external S-Meter to the 706 (without opening up the radio) and would be curious to know how many others might find this to be a desirable device. The meter functions exactly as the radio's standard meter and will also operate in Power, SWR, and ALC modes (fast or slow ALC).

I created the external S-meter because I just prefer an analog meter. It turned out so well that I am considering moving forward with producing the meter if there is enough interest.

I would enjoy hearing from those who might like to see a product like this and would appreciate any feedback such as what you think a reasonable price might be, etc. You can reach me at wd0ss_at_arrl_dot_net.

Thanks & 73!
Robert

"I've come up with a way to connect an external S-Meter to the 706 (without opening up the radio) and would be curious to know how many others might find this to be a desirable device."

I used to us the 706MKII for RFI searching. An external analog meter on top of the dashboard of my truck would have been VERY helpful, kind of hard to drive while looking down at the scale.

NOW, I have a 706 MKIIG, would really like the same thing, an external analog meter on top of the dashboard, or, even just a red LED bargraph, now that I think about it....

Anything out there for this?

Kurt

While not what you wanted, here is a program that you could run from a laptop that would be a lot easier to see.

Subject: [ic706] External S-Meter
To: ic706@yahoogroups.com
Date: Monday, November 19, 2012, 3:56 AM

Hello group,

I've come up with a way to connect an external S-Meter to the 706 (without opening up the radio) and would be curious to know how many others might find this to be a desirable device. The meter functions exactly as the radio's standard meter and will also operate in Power, SWR, and ALC modes (fast or slow ALC).

I created the external S-meter because I just prefer an analog meter. It turned out so well that I am considering moving forward with producing the meter if there is enough interest.

I would enjoy hearing from those who might like to see a product like this and would appreciate any feedback such as what you think a reasonable price might be, etc. You can reach me at wd0ss_at_arrl_dot_net.

Thanks & 73!

Robert

# 20175. 706mkiig transmits on wrong freq

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-20 11:04:06 UTC
From: Chuck Forsberg WA7KGX N2469R
Topic: 20175  Message: 20175

Recently, when I transmit on 147.54 FM simplex,
my 706 MKIIg outputs a signal on 113 MHz if the
power is set to LOW instead of the desired frequency.

If I increase the 706 power setting the output jumps from
113 MHz to the specified frequency after a short time
of perhaps 200 milliseconds or so.

The receive frequency is not affected by this anomaly.

Any ideas where to look?

> find a tech?

Have the same problem with my 706MKII. Turn it on and transmit (AM/ SSB ...) the power goes up to about 15 Watts and shortly falls down to about 5 Watt. Powerlevel is set to High. The power drawn from the battery is 12 Volt, 21 Amp - so it does draw power and also it is getting really hot too. Could it be a defective relay? Somewhere the power is burn'd and I have read about this problem on other sites too. Have not heard about a solution. Don't we have some good technicians here which could help?

Thanks
Harry from Germany

# 20180. Stolen IC 706MK2G control head and mic

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-21 05:57:21 UTC
From: kash_4k
Topic: 20180  Message: 20180

My control head and mic were stolen from Huntington Beach, Ca. So I'll need a replcaement if possible. If anyone knows where I could find one, let me know.

Another option is finding a broken body, but functioning control head.

# 20181. MDSR V2.5 has now been released (multi plaform IF-SDR interface) RIG upgrade

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-22 21:35:41 UTC
From: alexschwarz237
Topic: 20181  Message: 20181

Please join the group to access all the information and instructions on how to upgrade all different types of radios.

The new update builds on the multi platform system (FT-817,857,897, IC-7000, IC703,706 and more) and provides IF SDR capabilities to these transceivers. All that is required is the LIF2012 PCB and it connects the radio via the IF down-converter to the sound card.

The new V2.5 has a new filter slope setting for the RX and TX filter which allows to precisely tailor the LIF filter response for extreme audio clarity. Adjustment instructions can be found in the pdf manual which is accessible through the "Disk" icon on the MDSR-spectrum analyzer window - click on "Manual MDSR-J Engine".

The MDSR software is free to use as long as it is for non commercial HAM radio purposes.

Thanks a lot and have a great time with the new release;

The MDSR Team

I ran lots of AM on mine.  Set the power to about 25 or 30W carrier, and it should modulate fine.  I think I got about 85% or so out of it.  I used to drive an amp to about 300W carrier on 75/40m AM with excellent results.

Greetings,

I have a 706mkII that I run everything I can on. I have it interfaced with my PC through a Rigblaster (I have both the plus and m8 models setup for either my 703 or my 706 as they work interchangeably). For software, I'm currently using MMSSTV for slow scan TV, JT65-HF for JT65, and DM780 (from the HRD package) for PSK (31, 63, and 125), RTTY, Olivia, Feld Hell, and Domino. I've used/played with FLDigi too. I just didn't care for the program. Heck, I can even receive CW with my setup.

Before I start getting flamed about my choices, FLDigi is a good piece of software. It just didn't work well for my operating ways. You might love it and hate DM780, but that is one of the joys of this hobby. We can each do what we want to. Now for RTTY, I know it is AFSK that I am running. It my bother some purest out there. I know of locals that aren't happy that I run AFSK on my RTTY. I understand that. I'm more interested in in getting them in the logs not how my RTTY was setup to get them there.

I hope this helps.

73,

# 20190. FLDigi Issues (was: psk31 with ic-706)

Yahoo group: ic706 (2010 — 2015)
Date: 2012-11-28 19:13:52 UTC
From: LARRY J. FORD
Topic: 20190  Message: 20190

Not directly 706-related (although I have two), but I also tried FLDigi with my IC-7200 which I use for digital/soundcard modes (the 7200 makes it easy with a built-in USB/soundcard port - no interface needed), but I could get FLDigi to key the rig.

Receive was fine, but it just would not transmit. This was after I had already set-up Ham Radio Deluxe/DM-780 to run with the 7200 and those two problems worked great.

I never did figure out the issue with FLDigi and the 7200, but since HRD/DM-780 was already working so well, I ceased further efforts to trouble-shoot the situation and use HRD/DM-780 exclusively.

To make it 706-related, I'm getting ready to build one of Skip Teller's soundcard interface kits to use with one of my 706s for soundcard modes, but I will continue to use HRD/DM-780 as the software.

for RTTY AFSK vs FSK -- you're right that end result is the same, but note with FSK you get to take advantage of the 706's RTTY mode narrow filter (with AFSK it's in USB or LSB mode so don't get that) AND you don't have to worry about ALC & soundcard audio out levels. ... OTOH AFSK is easier to get going hardware wise.

I use the DXLab Suite which includes WinWarbler ... MultiPSK, MixW,
FLDigi, HRD/DM780 are common, too ...

for interface (706MKII here), need three basic things:
radio audio out going to soundcard line-in (or mic-in)
soundcard audio out going to radio line-in (or mic-in)
a way to key TX -- PTT line or VOX

Several options for doing this:

A) The proof-of-concept way -- just put computer mic by radio speaker, and
radio mic by computer speaker ... and for PTT manually key mic. It can
work just to see some decodes ... obviously not a real solution, but fun :)

B.1) directly connect the audio ... This can work, but is prone to ground
loops/hum problems ... But maybe just to get going and see some decodes
and some proof-of-concept TX'ing.

B.2) connect audio, but with 1:1 isolation transformers ... lots of
circuit diagrams on the web ... Including Dec2012 QST -- article on a
simple voice keyer interface, which is really most of a digital interface
-- just need the
I used the ISOKit (discontinued) from BuxComm, and go to the ACC Jack on
the 706MKII.

C) pre-made interface, like rigblaster, signalink, MFJ, etc.

~~~~~

Definitely recommend getting a 2nd soundcard (if interface isn't a
soundcard itself) -- don't want the radio soundcard to be the windows
default soundcard.

~~~~~

The digitalradio yahoo group is a good resource, too, for help on getting
interface going, and for operation in any digital mode.

I use Digipan software for PSK31 and PSK63. For an interface, I just use an RJ45 LAN cable to plug into the mic jack and cut the plug off the other end and spliced the wires into a 1/8" to 1/8" jack cable that I cut in half. You can get both the transmit audio and the receive audio from the mic jack. Just plug the 2 jacks into the soundcard and use VOX to key the transmitter. Didn't cost me a cent since I had these cables laying around the house.

You can use the narrow CW filter for AFSK as well. In the initial start menu, tell the rig that it is the SSB filter instead (FL223). That way you can select it while in SSB mode for AFSK. Works fine on my 706 original, and I can use it on CW as well.

I made my own interface with some audio transformers and a 5v DIL relay for the PTT (data) and a Opto isolator for Morse (data jack won't take the non-zero ohm input for PTT hence the dual method).. Also made my own CAT interface using a couple of 2n2222 transistors

All the circuits are out there on the web if you need them.

For software it's HRD, JT65-HF and mmsstv (that covers most modes)

Hi Kymmy, I managed to use an opto isolator for
PTT as well. I connected an external transistor
in a darlington circuit with the transistor of
the opto-isolator and it works ok.

SignaLink USB for the interface. Digipan for the software. Have been playing with FLdigi (Ohio ARES recommending it for the modes they are experimenting with for HF digital), receives fine, but as others have stated, can't seem to get it to transmit on my 716MKIIG. I need to get around to downloading an updated version and trying again.

I was using the usual eclectic mix of component as found on various disassembled devices, the opto's I found on an old monitor board. I was using the Optos via the Mic port and it worked well but wanted to swap it round to the data port so the volume level out of the speaker wasn't an issue. Hence I just shoved in a 5v DIL relay via a switch where I can switch it between Data_PTT and KEY.

I never understood this buying of devices like a signalink when it's ever so simple to create your own.. Especially when all the theory is already done by anyone taking a level of ham radio exam passed the lower levels (UK foundation course for example)

What's even more puzzling is the number of hams who buy a rig like the ICOM IC-7200, which has a built-in USB port and soundcard device in the rig, such that it takes only a single USB cable from the PC to rig to run PSK-31 and other digital modes, who then insist on using or even BUYING a external device like the Signalink to run digital modes!

Why buy the 7200 AT ALL if you're going to do that??!!

I don't know if it's technically CI-V control or not, but there are circuits and modules out there, either home-brew or commercially-available, which plug into the 4-pin Molex connector tuner port on the back, and which "trick" the 706 into "thinking" there's an ICOM AH-4 or compatible autotuner attached so that when the tune button on the rig is pushed, the rig switches into CW mode and emits a 10 watt signal until it's told a tuning solution has been reached, or the tuning cycle limit is reached. That method basically fools the 706's microprocessor into "sensing" that an AH-4 is attached.

I and another ham just built one of those circuits yesterday into an interface so he could use an SGC-237 autotuner with his 706MKII.

Also, there are a number of programs out there (like Ham Radio Deluxe) which I believe have a "tune function" which may switch the 706 into low power and cause it to transmit a tone for tuning purposes. I use HRD with my 7200, and that function works with the 7200, but I "think" I may have seen in the set-up menus the same provision for the 706. That is probably using a CI-V command, if it does exist for the 706.

# 20207. IC706 MKII for sale with accessories.

Yahoo group: ic706 (2010 — 2015)
Date: 2012-12-04 11:27:52 UTC
From: George- K4GM
Topic: 20207  Message: 20207

Icom 706 MKII with microphone in excellent working condition and very good cosmetic shape but does have a few scratches which do not interfere with operation: Reduced from $575 to $525.

OPC-581 extension cable: $35
MB63 and MB65 mounting base and bracket: $60
MB62 mobile mounting bracket: $30

All of the above for $595.

PS-125 P/S: Reduced from $195 to $150.
SP-20 Speaker/audio filter : Reduced from $125 to $100
SP-21 Speaker : $80

Buyer of 706 MK II gets first option on cables/mounting brackets. Buyer pays shipping from zip 22742. Please contact me directly off list. Next week any unsold items are going on eBay.

Pictures available on any item.

73, George K4GM

From: g7aaq
Topic: 20210  Message: 20210

I have been having this problem now for a long time now and I think it might be a problem with the radio. I have it connected to the computer by a 12v powered CI-V interface that connects via the com port-this controls the radio as expected using HRD and FLdigi(In Linux). However the interface causes problems with interference on the radio. I have tried a usb CI-V lead and also a com port lead from G4ZLP. These fail to talk to the radio, but work perfectly with a friends IC7400. I am confident that the software is set up correctly. I have tried every combination of connections and settings that I can think of, including a powered USB hub. Has anyone had experience of this?

# 20213. Stiff VFO dial when turned on

Yahoo group: ic706 (2010 — 2015)
Date: 2012-12-13 18:44:14 UTC
From: John
Topic: 20213  Message: 20213

I have an Icom 706 original (so it is 16 years old or so) and I have noticed recently when I first turn on the radio, the VFO dial is rather stiff (the lever is in the least tension position). After the radio has been on for a while it does seem to loosen up some. Has anyone else noticed this problem? Could the encoder be going bad, or what else could cause this condition?

Try just pulling the knob out slightly, it's probably pushed on a little tight and as you turn it, it move out slightly. The Knob is only a push fit and seems to get tighter over time.

I don't believe ladder line should be buried, unless you suspend it in the middle of a large "pipe" with nothing else around it - don't know if even that would be permitted. Even though it is insulated by your PVC, it is still too close proximity to other objects (the earth). Ladder line should be as free from other objects as possible. That's why they made standoff insulators, etc.

Stan, yes, worked fine. I put a gentle twist on it like they advise you to do when running balanced line near anything metal which probably wasn't needed and fed an all band doublet with it just fine, I think a good solution where you want low loss on a high swr antenna and you want the line concealed 73 Scott

Make something good happen!

From: vk4zpp1@bigpond.com
Topic: 20218  Message: 20222

The recommended installation for 300 ohm line when run down a metal mast was to use stand offs and twist the line about each 6”. But then you could buy 72 ohm cable which most amateurs weren’t too fussy about installation techniques.

I have used TV ribbon (unslotted) at 70cms and the important thing is to maintain balanced spacing to any reactive surface. Try twisting the ladder line inside the PVC pipe and even run fishing line or similar to hold it centralised in the pipe. Good low loss cable for up to 100-200W and up to at least 500MHz.

From: cax3nj
Topic: 20218  Message: 20224

Hi Gary,
Your comments are well taken.
I am attempting to feed a 40mtr dipole setup as an inverted V for multi band NVIS operation.
I am aware of the minimum 6in clearance that is customarily recommended when using open wire transmission line.
However empirically, with "all things being equal" and since the transmission line is not supposed to radiate it would seem that with 90% of the line laying on the ground and close up to other objects do not seem to present a noticable degradation to the system.
Other than coax, burying the line in PVC would probably solve a restricted community antenna problem.

I had forgotten all about this method, but you're right. Have a look in
the Handbook, or maybe the Antenna Handbook to see how to do this. It
allows balanced feed while still letting you get near other objects.

Thanks for jogging the old beans in the bottom of the pot. :o)

# 20227. Audio dropouts

Yahoo group: ic706 (2010 — 2015)
Date: 2012-12-21 07:06:10 UTC
From: nanandpeter
Topic: 20227  Message: 20227

Peculiar problem:
I live about 1 mile, line of sight, from a repeater site. I am using a duoband J-pole antenna. We run a weekly net on the repeater on 2 meters, and we link that machine to the 440 repeater operating from the same rack.
When I check into the net on 2 mtrs with my IC-706MkIIG, I'm told on several occasions that my audio is dropping for very short times, frequently, like, 3 times during a 10-coount, enough to garble what I'm saying.
This does not happen at all on simplex, or on the 440 side, or on the 2 meter side when the machines are not linked. And it's only on the 2 meter side when they are linked, not on 440.
And it doesn't matter what my power level is, 5 or 50W.
It does not happen with other radios (FT-817, Wouxun KG-UV3D).
What I'm wondering, among other things, is whether a strong 440 signal coming into the radio while I'm transmitting on 2 could somehow be causing this intermittency.
I know I can use one of the other radios when the two machines are linked -- so I do have a work-around. What I want to know is what the heck is going on!
I will greatly appreciate any input on this -- it's driving me a bit nuts! Thanks in advance.

Try reducing mic gain, it may have too much deviation somehow.
If its not a mk2"g" insure compression is off.

# 20229. Re: [ic706] Audio dropouts

Yahoo group: ic706 (2010 — 2015)
Date: 2012-12-21 13:03:52 UTC
From: Ken Winterling
Topic: 20227  Message: 20229

Peter,

Use your other radios to monitor your transmissions on the 2M INPUT frequency as well as the 440 INPUT frequency when the repeaters are linked. That will let you know if your 2M audio is cutting out as well as the possible appearance of a strong signal on the 440 input.

It is possible that there is a strong, unmodulated signal keying up on 2M, unintentional or otherwise, that is much stronger than yours (capture effect). That would make it appear as if your audio was dropping out. Again, monitoring your transmitted 2M signal would confirm the operation of your rig.

I don't know how the linking is arranged but if the 440 input is given priority over the 2M input then a strong, unmodulated signal keying up on 440, unintentional or otherwise, would make it appear as if your audio was dropping out.

Do these repeaters use CTCSS? There may be an issue with the '706 tone level/frequency when linked that is not a problem when not linked.

Someone came pretty close to what I was going to suggest. There's an off chance that the 440 rptr input has priority and will mute the VHF input on the repeater. If that was the case, AND if there was a spur coming out of the 706 that the UHF input was able to hear, it would mute you. Also, even if your 706 isn't putting out a spur, it may not be on the UHF input frequency, but could be on an image frequency. That's one reason it is hell to live near repeaters, etc. One other thing, the third harmonic of the VHF input frequency could also mix with an outside signal and show up on the UHF input. There are MANY ways this could go, and they usually aren't easy to find.

Since your other rigs don't have the problem, it might be that the third harmonic of the 706 is not filtered as well as the others.

Put the rig on a dummy load. You should still make it into the repeater in VHF and the UHF input shouldn't see enough signal from you to have a problem. See if that cleans it up.

# 20231. Re: Audio dropouts

Yahoo group: ic706 (2010 — 2015)
Date: 2012-12-22 14:48:48 UTC
From: Nan/Peter Strauss
Topic: 20227  Message: 20231

Amazing thing.
Last night I tried it again, lowering the mic gain as well as the output power -- same dropouts.
Then, another fellow from our group got on the frequency, and suggested that maybe something was
happening with the CTCSS/PL tone.  Also asked me if I had activated the RX squelch on my radio.
I went and looked, and it wasn't.  I've never used that function -- never had a need.
But just for the heck of it, I cycled it on and off (M4), to be sure, and while I was up, decided to change the
frequency of the RX squelch tone (Q7).
Got back on.
No dropouts.
Go figure.

Thanks for the thoughts/ideas.  I have no idea what happened, but whatever I didn't do, it worked hi.

When the brake is in the up-most position, does the tuning knob fly=wheel or turn freely enough to have a follow-through?
With the brake off the knob is not binding but somewhat stiff.

On my 706G the follow thru is slight but very smooth. No feel of dragging at all. Perhaps the lever mechanism is not fully releasing. I've never been under the knob on mine so not certain of the design.

Try pulling firmly straight out from the front of the radio.  Sometimes the knob can get pushed in slightly on the shaft and bind on the face.  Mine has done that several times.  BTW, it's just on there by friction, so it can be pulled off completely without hurting anything (by design).  It's how the face comes apart.

Joe,

Hi, just a quick thought turn the filter on, you will get a N in the top left of your display this will set the dev to a lower limit for use when narrow channel spacing is required, and all should be ok.

Hi all

I recently bought a second hand 706 MKII G with DSP.

When using 144MHz FM, I usually receive reports that my transmission is over deviating. At other times I receive reports that my transmitted audio is loud.

Is there a quick & easy way to identify if the signal is over deviating or is too loud?

Cheers

That sounds like you are tripping the repeater masking for the touch tones.

If the repeater accepts touch tones for autopatch or control features, it may be programmed to not pass the tones for security reasons. If your voice happens to emit a tone pair used by the touch tone circuits, the repeater may mute the audio thinking it is a touch tone.

# 20240. Icom 706 MK II for sale with accessories

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-04 15:33:08 UTC
From: George- K4GM
Topic: 20240  Message: 20240

Icom 706 MKII with microphone in excellent working condition and very good cosmetic shape but does have a few case scratches which do not interfere with operation: Reduced to $495.

OPC-581 extension cable: $35
MB63 and MB65 mounting base and bracket: $60
MB62 mobile mounting bracket: $30

All of the above for $550.

PS-125 P/S: Reduced from $195 to $125.
SP-20 Speaker/audio filter : Reduced from $125 to $90

Buyer of 706 MK II gets first option on cables/mounting brackets. Buyer pays shipping from zip 22742. Please contact me directly off list. Next week any unsold items are going on eBay.

Pictures available on any item.

# 20248. Re: Keying the HF and VHF sides of the IC-706 MK2 at the same time

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-07 19:49:33 UTC
From: Terry
Topic: 15786  Message: 20248

Hi All,

I was more than a little surprised by the ICOM Representatives comments.

I have had a look at the Circuit Diagram of the IC-706mkII and see no reason why these lines cannot simply be strapped together.
The reason for there being a separate V-Send and H-Send line in the accessory connector is to allow EXTERNAL devices such as HF and VHF Linear Amplifiers to be switched by the single PTT line in the Radio.

I will upload an image from the manual that shows this functionality.
These two lines would normally be labeled 'VHF_STDBY' and 'HF_STDBY' on another radio.

It is apparent from the diagram that the choice of which Linear is switched is controlled by the state of the Relay RL16.
This is controlled by the state of line 'L8' on Connector J9, via Q10.

IF the IC-706mkII is ONLY being used in its Native form with NO External Leads going to other peripheral devices other than the Data-Modes Interface then I see no, (Radio Side), reason to not just connect the two lines together.

If the Signal-Link is being used it seems from the manual that pins 3 & 4 on the DIP Header need to be shorted.

Each Data-Modes Interface would have to be investigated to see if any poor design prevents this being safe as far as the interface is concerned.
I have seen one interface where the manufacturer has neglected to provide enough conductors in the lead going to the 13pin plug.
Since only HF-Send has a wire in this case the lead or plug would have to be replaced.

I hope this has clarified matters.
I will upload the file 'PTT Lines.bmp' to the Files area.

73,
Terry Tipper, G1MZT

PS. I will NOT be held accountable for others inability to read a diagram, pin positions on a connector or any mistakes you may make!
This advice is correct to the best of my knowledge and is intended to help technically competent Radio Amateurs.

> "No, you should not connect both Send lines together. The radio actually has two separate sections and that's why there are two Send lines, so if they were both connected together, it would trigger both sections to transmit at the same time, and you can damage the radio. Instead, use an A-B switch to select either HF Send or VHF Send. Diodes will not work since both Send lines would be energized at the same time.

Terry

Take a look at the TX section of the driver stages.. The HF and VHF share the same device and are routed thru a relay to either HF or VHF network. I would say if its for external stuff make sure you maybe opto couple the two lines..

When you see such messages with either "no subject" or "unknown", and the message body contains only a link somewhere, do not click on the link. If you do, soon many similar messages will be sent out from YOUR email address.

Such garbage has been showing up regularly on every unmoderated Yahoo group. Whoever is doing this is getting smarter, one of them had a subject of "Welcome" and sometimes they say things like "Wow, you have got to see this!" to get you to look at it.

Please be vigilant and use common sense.

What is the "interference" that is being experienced? ("However the interface causes problems with interference on the radio.")

Is it RFI getting into the rig via the CI-V control cable?

Have you tried ferrite chokes or toroid cores on the control cable?

From: Ralph Mowery
Topic: 20253  Message: 20254

When the computer says com port can not be used, that is an indication the softwear is not set up correctly.  Did you take your 706 to the other station to see if it worked there ?

The 706 does have two settings to make it work with most softeware.  One is the baud rate and the other is the radio idenification number.  Forgot what Icom calls that on the display.
Those settings are for the speed of the data on the port and the id number tells which of several radios are connected to the CI-V line as several radios can be hooked up at the same time.

# 20261. Complicated problem

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-19 06:24:38 UTC
From: Peter
Topic: 20261  Message: 20261

I am 1 mile, line of sight, from a local 2/440 repeater.
Normally, I have no problem at all accessing the machine, either on 2 or 440, with my IC-706MKIIG. CTCSS works perfectly.

Recently (last 2-3 months), when I power up the radio just before our weekly emerg. prep. net, and the 2 and 440 repeaters are linked together, when I try to hit either machine, I get signal dropouts.
It's worsened when another repeater is linked in via IRLP.

Worst of all, it doesn't happen with either of my other two duo/triband radios (Wouxun HT, Yaesu FT-817).

However, tonight I tried an experiment, and let the radio sit, powered up, for an hour before trying. I had one of our tech committee guys link the 2 and 440 machines, and had no dropouts after the warmup of an hour.

Question: what in the world could be going on such that cold, I can't hold the machine when the 2 and 440 are linked, but warm, I can? What could be the difference that heat makes, but doesn't show up when the two repeaters are not linked?

Thanks for any help/insight,
Peter KO6R

Are you sure your power supply is supplying a full 13.8v to the rig? Is it possible that your power supply and not the rig itself might be the source of the problem?

From: Bob Reiff
Topic: 20261  Message: 20263

Take the rig out to your car and try to use it with a mag mount antenna. Also I assume you've checked the power output when cold in the house? The car will supply a new power source, new coax, and a new antenna. From there it is process of elimination.

Are you sure your power supply is supplying a full 13.8v to the rig? Is it possible that your power supply and not the rig itself might be the source of the problem?

# 20264. Icom 706: Powering on issues

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-19 13:48:17 UTC
From: KeithH
Topic: 20264  Message: 20264

I recently purchased an Icom 706 old version and it worked fine in both my mobile and home station but now is intermittent on whether it will trn on fully. Sometimes it just makes a clicking noise and doesn't turn on and sometimes it makes that same clicking noise and does turn on. Before this started happening the radio worked great. Part of me thinks it is an issue in the power connector or something in the power input circuitry that has gone bad or is loose. I am also running it off a secondary battery in my car and it seems to happen more there than in my house (though it happens in the house but less frequently). I am wondering if the battery in the truck is not supplying enough voltage though I have had many other mobiles that seem to have no issue with the battery.

Any recommendation or advice in this matter will be much appreciated.

The power connector seems to be a weak link in the 706 series. The pins are of the male/female variety. You might try using a very small pick or jeweler's screwdriver and try to tighten or bend the connector so it is a tighter fit. Too low of a supply voltage could be a problem as well. The rig requires 13.8 vdc to operate properly.

You might check the SO-239 connector for the VHF-UHF antenna. They have
been known to develop center pin fractures at the connection to the
board. When the radio is cold, it might not be making contact to the
outside world and after warming up, it does. Wiggling the connector
might point out if this is the issue.

From: Mark
Topic: 20261  Message: 20267

I had a bad fuse in the power cord that caused me no shortage of headaches before I figured it out.

Not saying that is your issue, but I'd start by checking voltage on the back of the plug at the radio, and checking the power output and also SWR of your antenna also at the radio. I suspect one of those 3 can point you is which direction to search for your actual issue.

I have a long 10' power lead from my spare deep cycle battery in my truck. It is brand new but the leads are 6 gauge ultra flex so I thought that would work ok. It seems to work with all other rigs I have had in the truck.

The power connector in the back seems in fairly rough shape so it could also be that. I will check into both. I had it running off a two foot lead to a dedicated 13.8 VDC 30 amp supply and it was a bit intermittent on that too but not nearly to the extent of in the truck.

From: Stan Broadway
Topic: 20261  Message: 20269

I've had some odd behavioral problems with the 706 and the Michigan repair people (great guys!) tested the rig itself to be fine. Turns out there are problems with the fuse holders in the power line. I bypassed them, and everything got back to normal. Apparently it isn't limited to the 706, it can happen to a number of radios with the same in-line fuse holders after time.

It's a video of my MKIIG having a psychotic episode.. Did you try it without the .html?
http://www.qsl.net/n9mxq/706 (It's an embedded video from Facebook)
The radio has since decided to not turn on again.. So, if I ever get caught up on bills I'll have to send it in for repair.

Are you running the 706 with the control head remoted? If so check out the screw that holds the remote cable to the head. that screw provides the grounding for the head to radio grnd. If it is loose you will see behavior like this. Also check the connection of the cable at the xcvr end.

If the head is directly connected to the xcvr try cleaning the contacts between the remote head and the xcvr. If the contacts are not making a good connection you will see this type behavior.

# 20274. Scan channel skip

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-21 17:43:18 UTC
From: Craig Pitcher
Topic: 20274  Message: 20274

I have a number of repeater frequencies programmed into my IC-706 Mk II G, however there is one local repeater that I would like to be skipped while scanning.

Despite programming as the manual says where each channel is marked to be scanned (and the little "S" appear on the screen), I cannot get it to skip this channel. (not showing an "s")

On my old 706 the skip function worked fine, although, as I recall you did it the opposite. (I tried that also).

Anyone know what could be the problem.

Thanks,

Craig

Craig,

Try pushing the scan button (F1) then the sel button (F2). These are in the S2 menu.

73,

Carl

AB1DD

Resistance is futile.

(don't know about reactance, though)

Thanks to all who replied to my plea for help/insight.
I have changed the cable from the bottom connector to the antenna switch, and will see if that, for some peculiar reason, makes a difference. If not, then I'll check inside the radio for the connection to the board.
The truly baffling part is that I have no problem if the machines are not linked; I need to find out if a higher level of PL is needed when triggering two machines through one.
Doesn't make sense, but none of this does, anyhow.
The only difference is up on the hill, not here in my shack. My radio doesn't know the difference between linked and unlinked.

Bewildering.

You should never rely on a system passing a tone (they are not supposed to). It should be filtered out in the receiver anyway, and then re-encoded on the second transmitter. Standard procedure.

Just want to verify a couple things with connecting my icom 706 to my THP HL450B. I bought the 13 pin connector and based on the manual for the amp need to use ALC with this amplifier. So I think my pin out will be 6 & 2 for the ALC RCA, and 3 & 2 for the key. Can anyone verify this for me? Is there any other way to key the amp or do I need to use the 13 pin connector, just curious.

Thanks,

Keith

For those who maybe interested I brought my icom 706 to a local technician who has worked on Icom radios for decades and he identified the following issues:

Problems were intermittent xmit control logic,relay driver and circuit trace integrity.

He also recommended that I purchase a new power cord with new connector which I promptly purchased off of eBay for $20. I did have another spell of intermittent operation when the power cord was leaning against a surface pushing it in a slightly awkward direction. I disconnected the cord and snapped it back in and the rig energized and has had no issue turning on and off and on since. I am hoping that the new power cable and connector will finally make this a rig that I can rely on.

# 20281. RE: [ic706] Scan channel skip

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-22 15:56:12 UTC
From: John Locke
Topic: 20274  Message: 20281

If it is channel one you cannot skip it.

John Locke

N5PPR

I have a number of repeater frequencies programmed into my IC-706 Mk II G, however there is one local repeater that I would like to be skipped while scanning.

Despite programming as the manual says where each channel is marked to be scanned (and the little "S" appear on the screen), I cannot get it to skip this channel. (not showing an "s")

On my old 706 the skip function worked fine, although, as I recall you did it the opposite. (I tried that also).

Anyone know what could be the problem.

Thanks,

Craig

I'm a litlle rusty but I think you want priority scan to do that.

Still having trouble?
I'll try to help.

Since it seems to be a temperature related issue, I would also check the PL frequency as well as amplitude.

If you are able to work with the repeater tech, ask to disable the PL requirement for testing while the repeaters are linked. This may narrow down the issue.

Thanks to all who replied to my plea for help/insight.
I have changed the cable from the bottom connector to the antenna switch, and will see if that, for some peculiar reason, makes a difference. If not, then I'll check inside the radio for the connection to the board.
The truly baffling part is that I have no problem if the machines are not linked; I need to find out if a higher level of PL is needed when triggering two machines through one.
Doesn't make sense, but none of this does, anyhow.
The only difference is up on the hill, not here in my shack. My radio doesn't know the difference between linked and unlinked.

Bewildering.

No maximum input is 50W. I got it working I think last night. At least the amp keyed and no protection came on until I went to power setting of 6. Just wanted to test the limits a little.

I bought the Ameritron ARB-704 amp buffer/keyer to use with my 706s and amps. The ARB-704 plugs into the 13-pin DIN ACCESSORY PORT on the 706, and then has lines running to the amp which terminate in the typical RCA plug for both the key line and the ALC line.

It is my understanding that the 706 can only key an amp by use of the lines in the 13-pin ACCESSORY PORT.

Better check the voltage/current specs of the key line on the amp to make sure it doesn't exceed what the 706 lines can handle.

The ARB-704 "buffers" and protects the rig from voltage/current "excursions" on the key line.

I misspoke. I don't trigger both machines -- I trigger one, and t'other comes up via the linking on the hill.

Since I have a workaround (either have the radio warm up for an hour, or use a different radio altogether -- the FT-817) I'm just going to let it all go. Much too much of a pain in the neck to chase down, and for one net per week, really not worth it.

Thanks again to all who shared their thoughts with me --

Right. The ARB-704 does not solve the 706 "leading edge power spike." It
does solve the lack of a built-in key line relay jack.

# 20292. Re: [ic706] Icom 706 to thp Solid state Amplifier connection

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-23 15:57:38 UTC
From: Keith Heimbold
Topic: 20279  Message: 20292

I guess I will not operate the amp until I get this sorted out. I just paid a lot for the HL450B and don't want to damage it.

I read the manual for the amp and I think there will be no issue or need for the arb704 but might put it in line anyway since it is gathering dust.

Thanks for all the recommendations.

Yeah Keith,
That's why I asked the question.
Most if not all 706's have a short power spike under 100w. I've never seen it on a analog meter but you can see it on the 706 meter.
I don't know positively that it would be a problem but better safe than sorry and I wanted you to be aware.

The brand new icom 7410 has the same if not worse problem.

If your like me after running the k3, the 706 not the same but holding on to two of my 706's for now.

73
Mike R

Play me some fiddle, but no stinkin' violin!

I am new to this old line of transceiver and may now consider bringing it back into the shack as a backup rig. The time in the truck might be short lived.

I am sure this spike is not much of an issue for a tube type transceiver when it goes back inside.

You can definitely see the 706 "spike" on an AWM-30 active, peak-reading wattmeter, which is analog. I've seen peaks as high as 150 watts on an "original" 706 and a 706MKII, and it doesn't really matter if the power output setting on the rig is set for 100 watts or partial output power.

While I will drive my AL-1200 with a 706 (the AL-1200 is stout enough to take that much drive), but if I need to drive my ALS-600 with a 706, I put one of Phil Salas' attenuators in-line between the rig and the amp.

I also have an ICOM IC-7200, and note the leading-edge power spike is much less pronounced and have no problem driving the ALS-600 with the 7200 at drive power settings between 45 watts and 65 watts, depending upon the band.

I ran a 706 in a big truck. I strapped the head unit to my leg.

Basically keeping the two I have with that purpose in mind and they are decent rigs.

I sold the mk2 I had recently and the buyer mentioned to me he had a problem locating brackets and separation cable and at normal prices.

It might be a good idea to pick up some accessories when spotted.

Have you tried it without the ALC hooked up? Some manufacturers recommend you do NOT hook up ALC between the radio and the amplifier. They provide the port for it, but say to not use it. Just turn the radio down to the recommended drive power and use it.

The ALC overshoot problem is not unique to Icom. Kenwood has a pretty severe problem with it too, especially in the 590. Some amplifiers will not tolerate the spike, and some will. I run the 590 with the KPA-500 from Elecraft. It tolerates the spike just fine. But I know some will fault off from overdrive. Tube amps just "don't care". I specifically asked the engineers at Elecraft about the ALC overshoot with the KPA-500 before I bought it. They said to not hook up and ALC and it will work fine.

Using the ALC line between the amp and the radio will not help the ALC overshoot problem. The radio is the one with the problem. It will still have the problem with it hooked up.

I have contacted Phil to see if I can obtain such attentuator from him. i have owned a number of solid state amplifiers, Quadra, FL7000, and THP, and never had any issues with my previous rigs (FT920, FT950, or K3) harming these amps.

Tube amps "do care" if they are low drive ceramic tubes. As in 30w drive for 1kw out.
Tube numbers like 3cx..... Or 4cx......

# 20302. CI-V/CAT Control for IC-706 w/Signalink

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-28 20:25:58 UTC
From: LARRY J. FORD
Topic: 20302  Message: 20302

For those folks who are using a Signalink USB with an IC-706 and HRD/DM-780, what are you using for CI-V/CAT control?

I have a Signalink USB on the way for my IC-706, but realized (doh!) that if I want to use that set-up with HRD/DM-780 in the same manner as I do with my IC-7200 (e.g., rig control), I need a separate CI-V/CAT control interface between the 706 and the PC.

Recommendations?

Thanks,

Larry J. Ford
KG4GPJ

I'm using DX Labs rather than HRD (But I'm looking at HRD now, might
give it a shot) and I just picked up a 706MkIIG last weekend, I
ordered a USB CI-V Cat CT-17 Cable off Amazon. The exact one I ordered
is out of stock now (there were 3 yesterday), but there are others on
amazon.

I per avoid the super cheap $10 ones on principle (I've had issues
with fake prolific chips on serial/USB converter cables) but I did
notice
http://www.amazon.com/CT-17-Interface-Cable-IC-7000-IC-703/dp/B003H7PC2O/ref=pd_sim_e_2
which is a serial version if you have a serial port. There are also
other options out there if you look around for a LOT less money than
the Icom OEM version, though at least with the OEM version you know
you're getting exactly what you think you are.

You can also get about the same thing off ebay for a few dollars.  I bought two circuit boards similar to that circuit a while back for About $ 8 including shipping. I think I could have gotten just one asyembled board for about $ 5, but there are many programmers that use the MAX232 chip so I thought I would get an extra one just to have around.  All you have to do is hook up the external wires and put it in a case if you want to.

That same circuit will usually work with one of the cheap USB to rs232 converters if all you have is a USB port.  There are probably some USB devices around also for not too much.

I don't know how bad Icom is ripping people off now, but it used to be over $ 100 for the thing that could be built for less than $ 10 if you had to buy all new parts.

With all the stuff comming in from China, it is amazing how cheap somethings are.  Unless you have a good supply of parts, it is often cheaper to get the whole thing.

Check on EBay for "CI-V Cable". There are quite a few for under $10 for
the 706 radios.

Thanks, but what you describe does not provide for rig control, which is what
I was asking about.

No need for CI-V just getting the audio into and out of the computer to the
rig via the Signalink.

Thanks to all for their comments.

I found a CI-V USB cable on Amazon with the FTDI chipset from a US-based company with free shipping for a reasonable price that can have it here in a few days, so I ordered that one.

I still may try building that "home-brew" circuit that was posted, though, when I get a "round2it!"

# 20311. AH-4 tuner power question

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-30 17:54:29 UTC
From: Wayne Bowyer
Topic: 20311  Message: 20311

Question concerning AH4 operation with my 706G. Once I tune a 20 meter freq (for example) and then pull the 4 pin tuner cable from the back of my rig---does the AH4 then default to straight thru operation?

# 20312. Re: CI-V/CAT Control for IC-706 w/Signalink

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-31 01:46:19 UTC
From: Michael Heit
Topic: 20302  Message: 20312

Hello fellows,

I am new to this list and only recently acquired a IC706 MKII with the AT180 antenna tuner. I bought a CI-V / CAT cable for this radio from an Ebay merchant listed here http://www.ebay.com/itm/PSK31-Interface-Full-CAT-Icom-IC-706-All-versions-/370543269051?_trksid=p5197.m1992&_trkparms=aid%3D111000%26algo%3DREC.CURRENT%26ao%3D1%26asc%3D14%26meid%3D5252009532710379096%26pid%3D100015%26prg%3D1006%26rk%3D1%26sd%3D370543269051%26

This cable has a DB-9 serial connector so I purchased a serial to USB converter and attempted to use the radio on an old laptop I have available. I had problems that were due to IRQ conflicts in the particular laptop; occasionally I could get the unit to work using Ham Radio Deluxe but doing so was a serious effort and no consistent. I built up a PC from a series of old parts I had sitting around and installed a used 80 GB hard drive that I formatted and installed Windows XP in the bare bones mode. I installed HRD and a few other ham radio programs for later use with a PK232 TNC and connected the radio up to the computer via the cable set I bought. It worked first time out and ever since with no problems at all. This last weekend I made my first ever digital contacts using PSK31 mode on 20 meters; two contacts were in Russia, and one in Japan and in all cases my reported signals were 599. Incoming signals were of the same quality so I guess the propagation gods were happy with me that day. The northern lights are active up here and the noise floor has been seriously bad for the last few weeks.

I found this cable set very easy to install and set up; I need to learn HRD and the waterfall program better, and as for learning the logbook function I also need to nail that down as well. The one drawback to the set up is that I cannot use the AT180 while using the computer connection as the 13 pin connector is common to both applications so I have to shut the radio down, tune in the band frequency I want to use, then reconnect to the computer before searching and sending messages. I am currently working on a set up where I can just switch between the two functions with out connecting and disconnecting either the radio, tuner, or computer. I am very happy with the system as it is currently working, and plan to make a video this weekend showing how to set up the cable connection, opening HRD using my IC706 MKII and hopefully make a contact while making the video. When I am done I will up load the video to my you tube channel located here: www.youtube.com/michaeldavidheit  the builder of the cable set has been a real champ in helping me get this set up going and has built a very high quality cable connection. If you wish to try this out keep in touch and I can hopefully be of assistance ... and make a QSO with a lot of you on this list.

This cable set cost me right at $52.00 with shipping to Alaska and is worth every penny if a person wants to get on the air quickly; just don't try using an old computer with a seriously over loaded hard drive and USB converter .... I need to flush that old laptop but now I want to look into connecting into a tablet with this radio ....  which is as good a reason as any I can think of to justify buying a new tablet. Or maybe a new KX3???

# 20313. IC706 MKII non G no 2m TX on SSB FM and others fine.

Yahoo group: ic706 (2010 — 2015)
Date: 2013-01-31 10:32:49 UTC
From: ZL1SWW
Topic: 20313  Message: 20313

Hi all,
I have a 706 MKII that has a wierd fault on 2m in that the unit will TX on SSB for a short time like 10 seconds and then will not show output after that. FM works fine on 2m and other bands OK.

RTTY works on 2m as well just SSB faulty. While faulty, the power meter still reads as normal.

Starting to suspect the ALC line (vfor line) maybe affecting it. The Vfor and for lines are joined at some point.

Any ideas or anyone seen this fault?

Cheers & thanks,

Simon

I remember trying another rig where the AGC had been disabled in menus, an FT-857, I think it was. It sounded as if there was something badly wrong with the receiver; very gruff, distorted audio, so turning AGC off is not a good idea and is probably why the option is not available on the IC-706. It is possible to achieve something similar to not having an AGC by turning down the RF gain (anticlockwise), and is quite an effective method of reducing noise on receive.

I use the 706 for a lot of data, for that an off on the AGC would be very desirable. The only way would probably be a circuit mod but as yet none have been found.

Here we go again on MRF255 finals.
There are many and vastly conflicting results
about this via Google. I've even seen people
say to use a device that turns out to be a bipolar.

A lot of people ask. Few get meaningful answers.
I take it no one has come up with a real fix?
I've ordered a couple of the chinese "knock-offs"
and am crossing my fingers ;-)

It seems to me someone came up with a fix. It may have been quite involved.

Also some kind of repeater final.

Maybe they will share again.

I probally have those emails buried somewhere.

I just sold a mk2 not g and noticed the markings I could see on one of the finals appeared not to be what the manual prescribed.

Good Luck and if the Chinese parts work out please share.

Nope; I just bought a $27.00 (USD) CI-V/USB cable with FTDI chipset that works just fine with my IC-706 and HRD/DM-780, etc., for keying the rig, changing frequencies, and other basic functions.

I do note that HRD controls fewer rig functions on the 706 under CI-V than it does on my IC-7200 using the built-in USB/CI-V/CAT port on the 7200, but have not had time to fully explore the CI-V commands and functions on the 706.

I bought it off Amazon from Valley Enterprises, labeled ICOM USB CT-17 FTDI (part no. RPC-I17-U).

Note: the 706 I'm using it on is an "original" IC-706, and I have not tried it with my IC-706MKII, but as the CI-V addresses are the same, it should work with the MKII also.

If you've used all these different cables and the same computer with no luck, have you tried a different computer, and/or double-checked the CI-V address you're using?

I'm using the same cable on my MkIIG

I had a minor annoyance with the drivers but sorted it quickly (I'm
running Win7 Pro and HRD but it worked with DX Commander too)

Yes, but you can't set them via computer control. Can only be set from the front panel.

A lot of the functions are not programmed into the IC706. I don't remember the list but duplex, PL tone and S meter are a few not implemented.

Nope; I just bought a $27.00 (USD) CI-V/USB cable with FTDI chipset that works just fine with my IC-706 and HRD/DM-780, etc., for keying the rig, changing frequencies, and other basic functions.

I do note that HRD controls fewer rig functions on the 706 under CI-V than it does on my IC-7200 using the built-in USB/CI-V/CAT port on the 7200, but have not had time to fully explore the CI-V commands and functions on the 706.

I bought it off Amazon from Valley Enterprises, labeled ICOM USB CT-17 FTDI (part no. RPC-I17-U).

Note: the 706 I'm using it on is an "original" IC-706, and I have not tried it with my IC-706MKII, but as the CI-V addresses are the same, it should work with the MKII also.

If you've used all these different cables and the same computer with no luck, have you tried a different computer, and/or double-checked the CI-V address you're using?

HTH.

In a word "yes" - without doing some fault finding we could only guess at what, or indeed if anything is damaged in the radio. Could be the radio settings, could just need a reset??

How many "cables" or "leads" have you tried? What types, brands, etc., have you tried.

It's possible the CI-V jack/port on the back of the rig is defective or damaged.

If you have a friend with a 706 of the exact same model as yours who has a CI-V cable that is known to work, borrow that, and if it doesn't work, there may well be an internal problem.

I believe I have read that it is not unusual for CI-V cables that terminate in USB plugs to have bad chip sets for the serial to USB conversion.

And, not intending to be insulting, but you are plugging the rig-end plug (1/8" mono plug) into the correct jack/port on the back, right? The CI-V ("Remote") jack sits immediately next to the RTTY jack and look similar.

Where are you located?

From: LARRY J. FORD
Topic: 20321  Message: 20330

I think the point was whether those three functions (i.e., " duplex, PL tone and S meter") are implemented in CI-V commands, so that they can be controlled "remotely," such as through Ham Radio Deluxe or other "rig control" software.

Those functions are, of course, implemented and available directly from the manual controls on the 706 itself.

As I noted originally, the IC-7200 allows every function and command I've tested so far (but not necessarily all) to be controlled through the USB port on the rig (which also implements CI-V control) and thus available for computer control in HRD. On the other hand, HRD can control only the most basic functions on the 706 from what I've tested so far.

I remember popping a component in the rig that kept the C-IV from working. I'd have to dig pretty deep to try & remember what it was though. It happened years ago when I was running a non-resonant band on a dipole & got a bunch of RF in the shack.

From: Ralph Mowery
Topic: 20321  Message: 20332

While the 706 has many functions, many of them are not put on the CI-V buss.  It is bad to try and save the memories and only get part of the information.  Then when you load it back in the 706, you have to go back and manually enter most of the information so you can work the repeaters.  I was thinking the s-meter was on the buss, but it has been so long ago that I tried it, I may be mistaken.

Also programs such as HRD will not be able to access all the functions in the 706.  The 706MKII is not any beter than the origional 706.  This is not just HRD, but all programs.

Well, yes, everything you say is obviously true to my knowledge.

I think that was the point.

The 706 in the shack is merely a "back-up" to the IC-7200; my IC-706MKII is mobile, and I'm not really concerned about rig control while mobile.

# 20334. CAT Control

Yahoo group: ic706 (2010 — 2015)
Date: 2013-02-11 16:12:36 UTC
From: R. Blackman
Topic: 20334  Message: 20334

not to belabour the points:

1) ensure that your computer software has the correct com port set.
2) often plugging a usb converter into a different usb socket changes the com port used
3) make sure the correct radio is selected in the software. 706, 706MKII and 706MKIIG all differ.
4) check your software to make sure the correct CI-V address and Baud rate is selected for your radio ( see point 3) also CTS is off
5) make sure you have plugged the 1/8 plug into the correct jack on the rear of the radio
6) go into the setup menu of the radio and make sure the correct baud rate and CI-V address is set. See owners manual.
7) if you have access to an oscilloscope, test the 1/8" phono plug from the serial converter to see if you have data spikes while trying to connect to the radio.
8) test each component at a fellow ham's shack if they have a known working system.

hope this sums it up.

From: R. Blackman
Topic: 20335  Message: 20335

one more point to consider:

in order to set the correct com port in your software,
you need to know which com port your usb converter is emulating.

for example, in Windows XP, go to: control panel / system / hardware /
device manager / ports ( com and LPT) to see which com port your usb
device is on.

now you know the correct com port to select in your software ----> very
important.

# 20337. IC 706MKIIG Problem

Yahoo group: ic706 (2010 — 2015)
Date: 2013-02-12 03:45:33 UTC
From: Rod
Topic: 20337  Message: 20337

Hello to the List. I have an IC 706MKIIG with the volume and 's' signal that fades and the power is almost gone - 2 to 5 watts out on LSB. I key the mic and it came back to normal once. Then it did it again and keying the mic did not work. Pushing the band switch and coming back to the original band worked. Now it works just fine. I checked all coax fittings first, all were tight. I unplugged the mic a couple of times with no change. I removed the face and replaced it, no change. Now changing the bands does not work.

Has anyone else had this problem? What did you do to fix it?

This radio is used in my shack and in my RV once a year during vacations.

Thank you ahead.
Rod kc7vqr

There is also a test for the ci-v port. If I'm not mistaken, you short the ci-v line to ground and then power up the radio?

There should be a message displayed to let you know if the ci-v line makes it all the way to the CPU.

If it doesn't, you know there is a hardware issue.

I'd research this test and try it... That rules out bad EBay ci-v cables, USB, etc.

The OP obviously doesn't have the patience to wait for a post giving a possible cause as he unsubbed from the group last night. Presume he'll now have to programme in the CB channels the hard way.

FWIW this was a fault with my previous 706G and diagnosed using Kyles method.

Ha! That explains a lot!

He acted like he had spent a ton of money on "cables" and "leads" but not all that much more than I spent on one, good quality CI-V to USB cable with a good chipset that actually works!

I noted the guy didn't post a callsign. Perhaps that should be a requirement of listserve membership/posting privileges?

# 20344. 706 scan speed

Yahoo group: ic706 (2010 — 2015)
Date: 2013-02-18 04:16:38 UTC
From: radiow4ron
Topic: 20344  Message: 20344

Hello to the group, I'm a new member, I use a 706 as the main
HF rig in my amateur station, I also have a vintage Kenwood TS-520s,
my AM station consist of a Viking 2 and National NC-183D and Hammurlund
HQ-129X receivers.
My other main hobby is collecting antique radios and vacuum tubes.
You can visit my museum web page at; http://radioheaven.homestead.com/

I have 2 questions about the 706, first is there an AM filter available for it? I've asked around and no one seems to know anything about one. I'd like to use it for AM operation but in AM mode the front end is so wide open I can hear sidebanders 10kc on either side of where I'm tuned.

Second, I'm also interested in monitoring the HF areo bands and have programed about 50 frequencies in to scan but the scan rate is SO SLOW.
I've got it set to the highest speed but it still takes about 10 seconds on each memory location before it moves on to the next.
Is this normal? Is there any way to make it scan faster?

73, Ron w4ron

To elaborate on this response:
The function of the RF Gain knob can be change to be a squelch control for SSB operation. With the squelch closed, you will have normal scanning, just like FM. What you are experiencing now is the 706 scan circuit sensing a signal since the squelch is open and stopping on each channel for 10 seconds and moving on.

I never found scanning in SSB mode real effective, but give it a try.

In terms of AM filters Icom does make the FL102 which is a 6khz AM filter for the mhz IF. It isn't listed as an accessory for the 706 series, but it should fit. You can see all of the different filters at:

http://www.ab4oj.com/icom/filters/list.html

Topic: 20344  Message: 20349

I think the original poster indicated he wanted to monitor the "HF aero" bands and had programmed certain frequencies from those bands.

For the life of me, I can't remember whether the HF aeronautical bands use SSB or AM mode. I know for a fact that the VHF bands for CONUS aviation operations are AM mode.

Once out of range of VHF on "over-the-water" or off-shore flights (e.g., transoceanic), aircraft are required to use HF frequencies to stay in contact with ATC.

I don't know if the scanning features of the 706 are different for AM mode vs. SSB mode.

From: aa8p_ralph
Topic: 19055  Message: 20350

Hello All, I am new to the group and have a recently purchased a IC-706MK11 that has a problem. I get audio feedback thru the speaker when transmitting. I did a search here and found a previoue post about this problem and sent a email but have gotten no reply. I would appreciate any help in resolving this problem.
Thanks in advance,
Ralph AA8P

Ron,
If you have the Original 706, it does very well on AM. I used one with an amp running about 300-350W carrier as fully modulated as it would go (about 90% I believe) and sounded good on the air with true double-sideband AM (as opposed to some rigs that ran single sideband with a carrier). I assume you have tried AM-N with the FIL softkey, right? It will use the SSB filter for RX (2.4k). However, that was a bit TOO narrow for me, so I installed the 2.8k which really was closer to 3k by my measurements. It was EXCELLENT for getting rid of the adjacent user trash.

Honestly, I don't think that one is compatible unless some unusual mods are done to make it work in the AM slot. The AM filter that's there is a single crystal can, so the edges aren't sharp at all, which is why it sounds broad as a barn door.

The screwdriver will tune to reasonance anywhere from 80-6 metrs with the right stinger. The issue is the feedpoint resistance. it will tend to be low. When i was using one i used the "dollar special" from an arrl handbook many years ago. its just a coil made with 10 or 12 gauge solid wire with a clip lead to adjust for 50 ohms. The coil goes from feed point to ground. Tune antenna to reasonance then adjust coil for best SWR.
Once its all figured out its quick. you can have clip points per band and just clip on for band change and then adjust antenna for best SWR and you should be at resonance.
Barry
NF1O

It works for any mobile antenna.

Why would you need any tuner at all? If the screwdriver is set correctly
for a given band you should have a 1:1 (or very close to it) match.

Why would you need any tuner at all?  If the screwdriver is set correctly
for a given band you should have a 1:1 (or very close to it) match.

I had a turbo tuner that I sent to Bill who owns the company for a modification and he never sent it back. Try as I may he won't respond to phone calls or emails. I bought it at HRO and they told me they don't supply them anymore. So I am out $200 and have no recourse.

I believe that both manufacturers of the automatic tuners have discontinued them. One was called the TurboTuner. I don't recall the other but a little googling for screwdriver antenna tuner should turn them up and maybe you can find one on eBay. There is a simple design that will connect to the antenna motor drive lines and put the 706 in tune mode. That dramatically simplifies the tuning process, but you still have to watch the swr meter and stop at the dip. If your antenna has the turns counter switches built in or you are capable of adding them there are several tuners (MFJ, tar heel, and others) that will send the antenna to a particular preset point without operator supervision but you still have to fine tune it for minimum swr.

Hi.

Bar meter in function display, set for power, how do you know what the relative output power is,ie when you tx and 3 bars are shown how many watts does that reading represent.i did notice on the bottom of the display was po number 5 and number 10. reason for asking, i am using the wonder wand antenna system and the max power is 10watts, apologies if i am missing something simple.
Any help very much appreciated

Regards 73 John

There is no exect ammount of power output per bar on the meter.  The power does not jump in steps (well, it might be very small steps) as you go from bar to bar when the knob is turned.  As the knob is turned, an external wattmeter will show a smooth increase and after a shot time, the next bar will appear.
I am sure your Icom will be slightly differant,but here is what I measured on mine.

Icom 706MKllG Power Output

Setting
     3.8 28.5 50.2 144.2 432 440 449  frequency

Personally, I would put a known, good peak-reading wattmeter (if reading SSB output) downstream of the rig and measure the indicated power vs. the rig's internal "bar" meter reading.

Half-scale would normally be 1/2 of rated power, I believe, but it does not always work out that way depending upon a number of factors.

I've done the same type of measurements on my MkIIG and it's a bit different than what you show. If one really wants to know for sure they'll have to test their own unit.

Further to the Low Power display/output.
Is any one running this rig as QRP?
What is the DC Current draw at this level?
Will a 12V 7Ah battery be useful for this?

# 20369. Re: [ic706] Re: 706 as QRP Rig

Yahoo group: ic706 (2010 — 2015)
Date: 2013-02-21 16:22:19 UTC
From: LARRY J. FORD
Topic: 20369  Message: 20369

This has been discussed before and should be in the list serve archives.

Those who have tried running the rig as QRP with battery power have been sorely disappointed, including a ham friend of mine who tried it with a 12VDC 7 AH gel pack battery.

It draws way too much on receive, nearly 2 amps with the speaker volume turned-up.

Here's the specs from the manual:

"Current Drain
(at 13.8VDC)

Receive squelched 1.5 A
max audio 1.7 A"

Note, also, full power transmit current draw is 20 A; however, even that QRP power levels the 706 draws more current on TX than a rig specifically designed for QRP. In other words, although 5 watts QRP SSB may represent only 5 % of the full rated power output, it does not draw merely 5 % of 20A. There's not a linear relationship of power out to current draw.

It is not a QRP rig for battery operation in the field. When I deploy to the field with my 706 for use with an NVIS HF station in support of a 100-mile bike race through the mountains of North Georgia, I power it with a 75 AH marine battery.

I often do.

> What is the DC Current draw at this level?

RX ~1.3A, TX @ 5W ~6A.

> Will a 12V 7Ah  battery be useful for this?

In a Field Day setting/duty cycle a 7Ah gel is good for about 2 hours. "Casual" operating would be a bit longer.

# 20371. New MDSR Version 2.51 released ☐ includes AM, DRM (Dream) and FLDigi for digital

Yahoo group: ic706 (2010 — 2015)
Date: 2013-02-21 17:19:20 UTC
From: alexschwarz237
Topic: 20371  Message: 20371

Hi Everybody;

The MDSR group has released version 2.51 of the popular 12kHz IF modulator and demodulator software. The new software includes now AM (synchronous detector), DRM (Dream) and digital modes provided by FLDigi, which also includes a logging data base. This makes the MDSR the most versatile IF modulation and de-modulation package which can be used for free as long as it is used for amateur radio use.

Please download the latest MDSR software from this link, size: 12MBytes

http://www3.telus.net/public/bc237/MDSR/MDSR-Win32-SetupV2-51.exe

Installation, setup and tuning instructions can be found here:
http://www3.telus.net/public/bc237/MDSR/Overview%20Document%20How%20to%20build%2\
0and%20set%20up%20the%20LIF%20-%20MDSR.pdf

Please check out or Yahoo user group: http://groups.yahoo.com/group/mdsradio/

Or our website at: http://users.skynet.be/myspace/mdsr

All the best:

The MDSR Team

Good day all,

I have recently acquired an IC-706 (non MKII). From a quick glance I could see that the extended TX mod has been done.

I fired it up last night and although HF/6m is fine, there is no FM/SSB TX output on 2m. 2m RX is fine.

A reset was done and on 2m TX it draws 2.9A. The front panel bar graph shows no indication of power out in all modes and neither does the watt meter.

Searching through the forum did not yield the results that I was looking for and Google was not too much help either. Any help or suggestions on where to start troubleshooting would be much appreciated.

It sounds like the Final vhf device is pooched.. If you have a portable radio see if it is at least transmitting ..at 3amps draw it sounds like the final.

I've fixed my 706 mk2 non G and I was able to find a final out of a old VHF marine radio.

good luck

# 20376. Yet another idiosyncracy

Yahoo group: ic706 (2010 — 2015)
Date: 2013-02-27 17:54:56 UTC
From: Peter
Topic: 20376  Message: 20376

My beleagured 706mkIIg has come up with another weirdness:
there is a broadcast FM station about 1 mile from me, putting out 40KW.
On 144, almost from end to end, it clobbers my poor radio.
I can almost make out the content on FM, and when I switch to AM, it's even clearer!
Peculiarly, the broadcast station has NO impact whatsoever on either my Wouxun HT or my Yaesu FT-817ND on 144. Zilch.
I have been in touch with the chief engineer of the station, we have had some great chats -- he's also a ham, and that helps -- and he tells me that he's double-checked and his station's sig is clean.
What in the world could be going on in my poor ol' 706, and what might I do about it?

Thanks for any help,
Peter KO6R

Sounds like basic overload. Does it help if you enable the attenuator?

I had the same problem with a local TV channel 2, and operating 6M. I ended up making a stub filter to notch out the TV station and it made 6M useable. I've noted IM products on HF too, when connected to a "real" antenna. My 746Pro does not suffer the same issues on the same antennas, so it is just the way it is with a 706.

Thanks, and thanks to the gent who replied to me privately, whose privacy I will respect by not naming him here, and who suggested a stub filter, too.
I shall try that as soon as I can get to it, and report back my results.
(In the meantime, my friends and I have decided to use a 146 simplex freq instead of 144. Much much quieter there :-) )

If you have a cavity that will tune 2m, I'd use that. Stubs are quite
broad. You can tune the cavity and get more rejection. I've used the
stub with success, but it is quite disappointing when you sweep it and
see what the bandwidth is.

Stub filter, 1'8.75" long, does the trick! Amazing!
Thanks very very much to you and to the other fellow, whom I've acknowledged privately.

Great stuff! I'd never heard of a stub filter before.
Glad to know about it.

Thanks, and thanks to the gent who replied to me privately, whose privacy I will respect by not naming him here, and who suggested a stub filter, too.
I shall try that as soon as I can get to it, and report back my results.
(In the meantime, my friends and I have decided to use a 146 simplex freq instead of 144. Much much quieter there :-) )

That's too short to work as either an open or shorted stub filter @ ~100MHz. Sounds like you made a quarter wave stub for 146MHz.

You probably won't beat that price. :o) Most hams that have been around 2mFM or rptrs for awhile accumulate cavities and other things like that. They are pretty expensive to just go buy new though. Look at swapfests. It doesn't take one of the big high-Q ones, just something to act as a bandpass filter. It will greatly reduce anything out of the band it is resonant for. From the sounds of it, you probably don't need it, since the stub took care of it for you. It likely wasn't a very serious problem and just took a bit of attenuation.

Are you saying that this site is incorrect?
http://www.arcticpeak.com/antennapages/quaterwavestub.htm
That's the page I used to calculate the length of the stub.
And, by the bye, it doesn't attenuate any 146mHz signals.
If you can refer me to a more correct page with the information I need, I'd be very appreciative.

I think Mark forgot to factor in the velocity factor of the coax.  Around 19 inches is 1/4 wavelength near 144 Mhz, but that is in free space.  You have to multiply that by about .6 to .85 depending on the type of coax you have.  That makes the electrical length of the coax stub longer than the physical length.  It could be anywhere between about 95 to 120 Mhz depending on the kind of coax.

The above numbers are not exect, but  a close estimation.
.

> Are you saying that this site is incorrect?

No. It is correct and the number you came up with is correct. I neglected to account for velocity factor. I recognized the length you came up with as a quarter wave for 2M but when velocity factor is applied, the frequency ends up around 94MHz.

This technique was common in the days of more prevalent paging interference from 155MHz. I made my pass/notch for 6M/TV2 using heliax and a series coil. For your application you're well beyond the notch and should have little to no attenuation at 146MHz, and depending on the coax you used somewhere between 20 and 30dB at 94MHz.

Yep, you're right. .66 is quite a shift. I've been playing too much lately with antennas where that's not so much of a factor.

What's a "TU" unit?

The 706, with an appropriate external sound card device/interface (Signalink, etc.), which is recommended by most digital sound card aficionados, can do digital sound card modes, and with some interfaces just use a PC's internal soundcard (e.g., Skip Teller's home-brew sound card interface). The software for such modes generally includes RTTY emulations.

Some folks say the sound card digital RTTY modes is not "true" RTTY (hardware-generated, I suppose).

To tell you the "hook-up" we'd have to know what you propose to do, use, etc. "Hook-up" to what from what?

There's lots of info on the web.

Yes, you can use the 706  without anything special.  All you need is a way to hook the speaker output of the 706 to the computer sound card audio input and then hook the  speaker output of the computer to the mic input of the 706.  Usually a couple of resistors are needed to cut the audio level from the computer to the 706 mic input.

Here is a  place with some links to some built units.
http://www.soundcardpacket.org/1cablekit.htm

Here is a link to some free and sharwear for the sound card modes.
http://www.muenster.de/~welp/sb.htm

I have copied rtty and psk31 with just the computer microphone placed near the 706 speaker in a quiet room.  While it could be transmitted by doing the same with the computer speaker and 706 mic, it would pick up a lot of stuff in the room and not relly be legal in most cases.

It would be better if you simply pulled the audio from the fixed level line on the 13 pin DIN, and fed the TX audio there as well. It's quite simple, and it's already line level so little if any leveling will be needed. I believe there is a schematic for the connections in the files area of this group -- check it out & see if that helps.

I made a very simple interface for my 706 a little over a year ago just using cables I had lying around. I cut one end off of a CAT-5 cable, which plugs into the mic jack. Then I took a 1/8" to 1/8" cable and cut it in half. One end plugs into the sound card in, and the other end plugs into the soundcard out. You splice the other ends of these half cables to the proper wires on the CAT5 cable. You can get both sound in and sound out off of the mic jack. Put the rig into VOX and go to it. You can also use a narrow CW filter on AFSK by telling the rig it is the SSB filter. It will then let you choose it in both CW and SSB.

Works fine for me. I worked TX5K on Clipperton last night on 30m RTTY for a new RTTY country.

This takes me back to the early days of digital modes. That's all we did. Two cables and VOX. Now the commercial market has push hams into needing another box to buy to make a simple interface expensive.

The reason to go in thru the mic CAT-5 input connector is to allow the use of the VOX. The VOX will not work for the rear connector. You will need to drop the computer sound output quite low to not overdrive the mic preamp, that is why many end up putting an attenuator of some sort in the mic line. A simple potentiometer is the easiest method.

I have uses acoustic coupling for both input and output with great success. Yes it is good to have a quiet room, so put the dog outside for the QSO.

What changed? Is it on or off? It can be on, or off, per band, so pre-amp on one can be attenuator on the other. Depending on the band and antenna, your rig can appear deaf suddenly. I've run into this many times, always catches me off guard.

Hi all,

My 706IIg is drawing approx 5 amps when switched OFF and becoming considerably hot.

Otherwise the rig appears to still function ok on tx/rx.

I haven't used the rig for a while and only switched the psu on today when using other equipment.

Does anyone have any ideas or suggestions please.

regards Gary

Gary .
The PA is wired hot to unswitched B+.

If it was me I would take a RF voltmeter and poke around in the PA and see if you have oscilation somewhere in the PA deck.

The lowlevel pre-driver is free-running so you will see rf when not transmitting but the current would be low.

I then would take the B+ off PA devices till the current drops off , that would at least narrow it down.

MAKE SURE YOU WORK WITH THE POWER DISCONNECTED FROM THE SUPPLY.

You could have a bad cap around the PA transistors

Mine was drawing 1/2 amp when switched off a few years ago. Turned out
to be a leaky PA transistor -- one of the old superseded Motorola ones,
but the Michigan Service Center had a replacement at the time.

# 20409. Chinese MRF-255 PA Transistors

Yahoo group: ic706 (2010 — 2015)
Date: 2013-03-06 23:21:19 UTC
From: David Stinson
Topic: 20406  Message: 20409

Well, I got my Chinese-supplied MRF-255 PA MOSFETs today.
I had only blown one of them (short), but ordered two "just in case."

http://www.ebay.com/itm/111001427877

It took about a month to get them.
Don't know why, but they did let me know up-front
that it would take awhile so no complaint.

I installed the "new" device and it is working OK.
The bias setting is considerably different than
that for the original remaining device. This may indicate
that the "Original Motorola MRF255" is, in reality,
a Chinese knock-off. But frankly, I don't care as long
as it works. I'm getting full output and so far, so good.
If it goes "poof" sometime soon, I'll let you know.

It was always common practise to replace both devices in a 2 device stage. Being a tech for Motorola we found that the older device would usually crap out within weeks...so I always replace both and keep the old one as a emergency spare.

It only adds a few mins to the repair but it will save your butt down the road.

Good advice, Bruce.
I've just heard all these horror stories about "counterfeit devices"
and kinda wanted to "go slow."
I'll take your advice and replace the other device today some time.

I'd be leery about IMD with these unknowns. A wattmeter won't tell you if you're generating junk up and down the band.

You can't control the radio through the ACC socket, it's basically only for controlling ATU's and amplifiers and feeding audio in and out. Try looking for CI-V cables. there are hundreds out there from pennies to pounds!!

I'll second that one (though it seems to be out of stock), it's the
FTDI chipset version from Valley that I use with my 706MkIIG and it
works great with HRD or DX Labs stuff.

DO NOT think the $10 cables are "worth a chance" though, those things
almost universally suck.

If you have a serial port on your computer (rare these days), then by
all means get the serial version that was first linked (or build one,
they aren't complicated and there are a LOT of plans out there on the
intertubes)

From: Frank
Topic: 20420  Message: 20420

My 706KMIIG has a problem with Pwr on HF. The RF knob has to be set at 8:00 to 9:00 for full output. The squelch is not open till about 10:00 t0 11:00. Any way to fix that?

# 20421. Re: [ic706] RF/SQL problem

That's really weird. The RF/SQL knob is just a receive function. RF Gain or squelch. I think there may be a menu item to select one or the other for ssb, so if it's squelching on ssb I think you can change that in the menu.

Just to be sure, push and hold display button to get to rf out menu.

For rf/SQL turn rig off, hold lock button while powering on, I think this is is the initial set mode. #7 is rf/SQL. Mine is set to auto.

Topic: 20424  Message: 20424

I have an Icom 706 original (HF/6m 100 watts, 2m 10 watts) in decent physical shape with a couple of issues. The meter doesnt work on transmit, but works fine on receive. Also, on 12m and 15m the receive level sometimes drops down. It seems like a dirty relay. You click the mic button or key and it comes back to the normal level. It seems ok on the other bands. I have worked 223 countries with it in the past 2 years.

It has the hand mic, a short power cord with power pole connectors on it, and a copy of the manual.

Anyone care to guess about what such a rig is worth, or to make an offer on it?

Hi,

I sold mine locally here in San Diego about six months ago. It was the series 1 706 in better condition then yours it seem. It was fully functional with the MARS mod and an added filter. It included the brackets, proper power cord, hand mic and original manual. I accepted $400.00 and felt it was a fare offer.

I paid $450 for one with the MARS mod but it needed a new relay and some other repair from a local guy in San Diego and it now works perfectly. Repair cost me $150. I added the ssb filter for another $110. So for $710 I have a near perfect operating 706.

The gentleman who repaired it told me that the receiver beat all the original factory specifications as he also recalibrated it for me. I feel like maybe in total it was a lot to pay to get such an old radio but I really love it so I will overlook the total cost of getting it right and just enjoy it.

I got a Mark 2 (non-G) for $350 off of Craig's list a few months ago, and thought it was inexpensive, and not perfect.

Like Keith noted the filters can make or break you, so one with a cw filter probably worth $75 to $100 more.

Good Luck, Scott ka9p

# 20432. Rebeat problem 706 RF/SQL

Yahoo group: ic706 (2010 — 2015)
Date: 2013-03-21 18:00:53 UTC
From: Frank
Topic: 20432  Message: 20432

Well folks we still have not found a cure for the RF/SQL on my 706. Thanks for the couple of guys that added input, and I tryed all your suggestions. It must be a pot in the radio maybe I can ajust to change the thresholds on the RF/SQL. I get full out put pwr on all modes when the RF knob is at 8:00 but no receive until I move the RF knob to approx 10:00. So I think it is going to take a more tech person and familier to the 706 then I have been able to find. So thanks to every one that tried to help. Frank in Denver

Frank: When you have the RF gain set below max (12:00 oclock), you need to increase the AF gain to compensate and to get audio from the speaker. This is a useful technique in a high noise environment, it decreases the sensitivity and the noise. Signals are made readable by increasing the audio gain to compensate. Hope this helps, Paul, KJ4AMH

You aren't making any sense. The RF knob (RF GAIN) has nothing to do
with power output, which is set in a menu. Full RF gain is achieved at
the 12 o'clock position. Less than that will result in reduced gain. As
for squelch, it begins just past 12 o'clock and operates per your menu
setting choosing its operation. (Ignore what I've just said if the 706
is different from the 706MkIIg.)

Set to RF/SQL, the knob will act as RF gain from 7-12-O'clock, and Squelch from 12-7-O'clock. Set item 7 to RF/SQL and set the knob to about 12:30 and you'll never have to mess with it again. If set to Auto, you'll have to crank it around every time you switch from SSB/CW to FM modes. The "RF/SQL" setting is the most convenient.

Hope this helps

Thanks Paul for the info. That did not work. I can turn the volume all the way up or down or any setting and no receive audio as long as the RF setting is below 9:00 and it has to be there
for any show of wattage on the watt meter. Thanks any way.

First thing, try it into a dummy load. If that's ok, you have an antenna /ground problem ((I'm thinking RF feedback). If not, you have a rig problem.

From: KAWill
Topic: 20440  Message: 20440

I'm learning Iambic keying for the first time and it looks as though it will take some practice.

Does anyone know if Icom uses Iambic Mode A or Mode B? I have to release the paddles very quickly to avoid an extra dot or dash at the end of a character.

Related to this, are there any small external Keyers available that you like better than the Icom internal keyer?

Thanks, Kent

> Does anyone know if Icom uses Iambic Mode A or Mode B?

They don't spec it but I would say "A". At slower speeds, say anything under 25wpm it's usable but it's not a keyer I would want to use all the time.

> are there any small external Keyers available that you like better
> than the Icom internal keyer?

Compared to the one in the 706, pretty much any of them. K1EL is my favorite.

Although 20m would be a new band, this sounds a lot like the 15/17m issue.
Check that all circuit board mounting/grounding screws are tight.

# 20444. Re: Internal Keyer - Iambic Mode A or Mode B?

Yahoo group: ic706 (2010 — 2015)
Date: 2013-03-23 17:22:54 UTC
From: KAWill
Topic: 20440  Message: 20444

Mark - Thanks for the help.

The keyer in my IC-706MKIIG seems to be using Iambic Mode B. When sending the letter C, I can release both paddles at the start of the second dah and it still completes the dit at the end.

My understanding is that Iambic Mode A will only complete the element being sent after release of the paddles. It is fairly easy to test this by slowing the keyer down to 10 wpm or slower.

It would be nice to have Iambic A and B to try out and possibly the older Ultimatic mode as well.

The K1EL keyer does look excellent.

# 20445. Icom 706 and receive-rig or feedline problems

Yahoo group: ic706 (2010 — 2015)
Date: 2013-03-24 18:44:13 UTC
From: af5cc
Topic: 20445  Message: 20445

Here is a message I posted a few months ago about the receive level dropping off at times in my Icom 706 original:

"I have noticed for the past few months that the receive seems to drop
at times on certain bands-it started on 12m and now occurs on 15m as well. If you click the key or mic to quickly put it into transmit the receive comes back. To me this sounds like a dirty relay or one that is going bad"

Now here are some additional details, it seems to be occurring on other bands as well. 17m at times, and was doing it on 30m last night. Someone suggested to me that it could be a problem in the antenna system as well. I did some checking this morning, and have determined that it isn't in the low pass filter, the MFJ tuner, or any jumper coaxes in the shack. It would have to be in the feedline going to the G5RV, or the balun there. I haven't had time to change out the coax run yet.

I have also noticed that on 12m and 15m the receive will come back up by itself at times. Sometimes it is a quick drop down and come back several times in succession. Would a relay problem do this?

So, with this latest information, what is the better guess as to the problem-in the rig or the antenna system?

Hi Mike,

I removed the tuner and low pass filter from the circuit and hooked the antenna directly to the rig. It was still doing it so it is not the switch in the tuner.

From: Barry Miller
Topic: 20438  Message: 20448

My first assumption would be RF feedback, too.

But can you give us a bit more information, Lee?

What output power level have got the 706IIG set for when transmitting on 20 m? 100 w? 50 w? 5 w?

And are you using the front panel separation kit?

Icom conveniently made the connecting cable between the front panel and the radio body 5 metres long - a delightful quarter wavelength on 14 MHz! Can really suck in the RF, if you don't have good grounding - been there, done that... At 100 w, my 706IIG would simply lock on in transmit, and the radio had to have the DC disconnected to reset it. Not sure what it might do at lower power levels.

Subject: [ic706] Re: SSB modulation

First thing, try it into a dummy load. If that's ok, you have an antenna /ground problem ((I'm thinking RF feedback). If not, you have a rig problem.

>
> I have a 706=IIG in my car. On 20m SSB it does not modulate. I press the PTT and the power out bar goes to 50% and stays there, unaffected by talking into the mic. If I switch to 40m SSB it acts normally. I did the factory reset with no change. I plan to do the usual contact cleaning, etc. unless anyone has a specific cure. Thanks. --Lee

# 20449. HM-103 Microphone - No Holes for Sound to Pass Through?

Yahoo group: ic706 (2010 — 2015)
Date: 2013-03-28 21:59:59 UTC
From: KAWill
Topic: 20449  Message: 20449

I just noticed that my Icom HM-103 Microphone has a solid plastic case with no holes or slots for the sound to pass through.

It seems to work fine. Is the sound simply conducting through the case to the microphone element inside?

If so, maybe their intent was to keep water and dust from getting inside.

I think if you look close you will see a hole on the underside of a ridge.
Today most are using these "electret" elements and can be as small as a match head with very broad frequency response. They use a bias voltage usually 8v in which the 8v bias is then modulated so to speak.

Yes, it is a sealed case. The intent was to have a "close talk" mic that would not pick up background wind noise in mobile with the windows down. The first "mod" in the '90s, to improve sensitivity, was to remove the rubber grommet under the element to give better sound transfer. I later released the mod to remove the element and drill a small hole in the case and reinstall the element and grommet. Much better sound.

Yes, there is a tiny hole there, but the op should use only "little" words
when talking into it, big words may not pass thru the tiny opening.

Thanks all for your comments on the HM-103 Microphone.

I cleaned the slots on the microphone with a small brush and inspected them carefully with a magnifier and LED light. Sure enough, there are very narrow slits mostly out of sight in four of the slots to let the sound in. You can just barely see them.

Earlier I had heard about various modifications by amateurs to improve the microphone so it's possible ICOM made some changes over time.

Regards, Kent

I would have used a vacuum first, before a brush. Sort of like, it is
not recommended in cleaning your ears with cotton swabs. You jam stuff
up further into the ear.
